

STAGE 4 / TECHNOLOGY

Bucket Hat for a Cause

STUDENT WORKBOOK

Name _____ Class _____

50 pages • A4 • 25 sheets duplex • Edition 1.0 • Course companion

Illustrative cover. Follow the approved pattern and teacher demonstrations.

THE LEARNING PATHWAY

Your learning pathway

Read, investigate, design and record your own evidence.

Module	Learning focus	Pages
1	Textiles with a purpose	3–6
2	Safe textile work	7–10
3	Visual messages	11–14
4	Define the challenge	15–18
5	Develop and select ideas	19–22
6	Fibres, fabrics and sustainability	23–26
7	Decorative technique trials	27–30
8	Prepare for production	31–34
9	Produce the reversible hat	35–40
10	Evaluate and communicate	41–44
Folio	Your project decisions and evidence	45–50

Use the book alongside the course

Each module teaches three named sections. Paper questions are original formative adaptations; your teacher may also use the course's larger online checks, videos and demonstrations. The practical activities require the teacher-approved pattern, equipment instruction and permission.

Build your evidence as you go. Use the module pages for investigations and trials, then cross-reference them in the final folio. Teacher to confirm: current pattern version, local controls, approved processes and formal submission requirements.

Matching course <https://stevenowell.github.io/Year-7-8-Bucket-Hat/>

Edition 1.0 • 50 A4 pages • 25 double-sided sheets, long-edge binding. Print the PDF at actual size. The Word edition is editable; edits can change page numbers. Workbook sketches are not cutting patterns.

READ / OBSERVE / APPLY

1.1 Textiles are everywhere

A hat begins with materials. A useful hat begins with a purpose.

Textiles are materials made from fibres, yarns or fabric. Clothing is one familiar use, but textiles also appear in furniture, transport, sport, health care and protective equipment. A curtain and a sports shirt may both be textiles, yet they have different jobs. Their designers must ask what each product needs to do before choosing how it should look.

A bucket hat is an apparel product: it is worn on the body. Think of it as a system of connected parts. The crown fits the head, the brim surrounds it, the seams join fabric pieces, and the two sides allow the finished hat to be reversed. Decoration communicates a message. Each choice influences other parts of the design.

Worked example • follow the effect Imagine a hat made from attractive fabric that is too flimsy for its intended use. Its brim might collapse, changing the shape and making the decoration harder to see. Changing the fabric affects both function and appearance. A stronger-looking fabric is not automatically better; its comfort, handling and suitability must also be considered.

Figure 1. Illustrative design study: the product's shape, material and visual choices must work together.

Choose three interacting parts of the hat. Explain how one change could affect the whole product.

READ / OBSERVE / APPLY

1.2 Hats, users and sun protection

Design for a person doing something in a particular place.

Hats can express fashion, identity or cultural meaning. They can also provide warmth, shade or protection. A useful design starts with an intended user and a situation, because different users need different features. “A person who likes hats” gives a designer little direction. “A student wearing a hat outdoors while helping in a garden” suggests questions about comfort, fit and coverage.

The crown needs to sit comfortably on the user’s head. A brim provides coverage around it, but its shape, fabric and position affect how it behaves. A hat that slips over the eyes or feels uncomfortable may not be worn as intended. Fit is therefore part of function, rather than something to check only after decorating.

A bucket hat can contribute to a broader sun-safe routine. A classroom project is not proof of certified sun protection, and a hat alone does not provide complete protection. Use current school and health guidance for outdoor activities. In your design record, explain intended features without promising protection you have not verified.

Example • a specific connection For the garden user, comfortable fit matters because the hat needs to remain in a useful position while the wearer moves. This connects a feature to a need. “It looks nice” explains a preference, but leaves the need unclear.

Figure 2. Illustrative alternatives: compare the visible brim shapes. A photograph cannot establish fit or sun-protection performance.

Describe an intended user and situation. Explain two hat features that could respond to their needs.

READ / OBSERVE / APPLY

1.3 Designing for a cause

Give the hat a message that is clear, wearable and your own.

A cause is an issue or purpose that people care about. Your hat might communicate an environmental, health, social or identity-based message within teacher guidance. Visual communication uses choices such as colour, imagery, symbols, words and materials to suggest meaning. The aim is to help an audience understand a focused idea, while keeping the hat useful to wear.

Begin with respectful research. Find out what the cause means, who it affects and how your intended audience might interpret it. Record where your information comes from. Avoid using a striking image simply because it appears online. Cultural imagery, community symbols and campaign branding may carry ownership and meaning that a quick image search does not reveal.

Original design grows from understanding. You can learn that a campaign uses contrast to attract attention without copying its logo. You can also develop your own image for a researched message. Ask your teacher for guidance if a symbol or its use is uncertain. A complex graphic is not automatically a strong message: it still needs to fit the hat, suit the technique and remain readable.

Example • one message, two choices An original waste-reduction hat could use a simple repaired-circle motif and a restrained palette. The designer would explain these choices rather than claim they are an organisation's official mark.

State a possible cause, your audience and two visual choices. Add one boundary that will keep your design respectful and original.

Research record • Note two sources for your cause or imagery and what you need to check before using them. Label a planned source if it has not yet been consulted.

Research item and source	Meaning or audience	Use boundary / next check

KNOWLEDGE CHECK

Studio check · purpose

Circle one best answer for each question. Then begin your own evidence.

1. A symbol looks strong on paper but disappears when the brim folds. What does this reveal?

- ☐ A. A message is separate from the product.
- ☐ B. Shape and decoration need to be considered together.
- ☐ C. The colour must be wrong.
- ☐ D. The design no longer needs a user.

2. Which design statement makes the most defensible claim?

- ☐ A. This hat guarantees complete sun protection.
- ☐ B. Every bucket hat fits every student.
- ☐ C. A larger logo always improves outdoor safety.
- ☐ D. This hat is intended to contribute to sun-safe use alongside current guidance.

3. A campaign inspires your idea. What is the strongest next step?

- ☐ A. Research its message and develop your own design choices.
- ☐ B. Trace its logo because it is publicly visible.
- ☐ C. Use a community symbol without checking its meaning.
- ☐ D. Change one colour and call the logo original.

Activity 1 · Textiles and purpose investigation. Name one textile product in each context and explain its job.

Context	Textile product	Its job
At home		
Transport or sport		
Health or safety		

Re-read your user and cause on pages 4–5. What will you keep, refine or research next, and why?

READ / OBSERVE / APPLY

2.1 Practical-room routines

A ready workspace makes careful textile work possible.

Safe practical work starts before a machine runs or a pair of shears is lifted. A hazard is something that could cause harm. A control is an action or arrangement that reduces the risk. Seeing a problem is only the beginning: a useful safety record connects the hazard, possible harm and appropriate control.

Follow the teacher's current room instructions. Wear required protective clothing and enclosed footwear, secure hair and loose clothing, and remove or control jewellery as directed. Put bags in the approved storage place and leave walkways clear. Set out only the materials and equipment needed for the task so that the workspace stays manageable.

Check equipment and report damage, spills, broken needles or uncertainty. Do not test a frayed cord or improvise a repair. Stop, keep the equipment unused and tell the teacher. Practical work begins after instruction and permission, even when the equipment is familiar. A photograph or video can help you notice possible hazards, but it cannot grant approval for your actual room.

Figure 3. Illustrative workstation: look for organised materials, contained pins and a clear work area.

Write an ordered room-entry routine with five risk controls, ending with readiness for teacher permission.

LOOK CLOSELY

2.2 Tools, pins, shears and irons

Match each tool to its job and the control that keeps it useful.

A textile tool is selected for a particular task. Fabric shears cut fabric; paper scissors cut paper patterns. Pins temporarily hold layers in place, while a seam ripper removes unwanted stitches carefully. A marking tool transfers approved pattern information to fabric. An iron presses fabric and seams when its setting and the material are suitable.

Choosing the right tool helps accuracy, but correct use also matters. Keep pins and needles in an approved container or pin cushion, never in your mouth. Carry scissors closed and directed safely as your teacher demonstrates. Place sharp tools where they can be seen and retrieved safely. A hidden pin or blade can harm the next person who handles the work.

An iron introduces heat and steam hazards. Use it only after demonstration and return it to the approved safe position. The fabric, decoration and equipment determine the pressing method; do not guess a temperature. Pressing is a planned process, not a way to hide every sewing error.

Worked example • tool → function → control To undo an incorrect seam, choose a seam ripper because it removes stitches. Use the demonstrated method with fingers clear of the cutting point. “Be careful” is less useful than naming the hazard and control.

Activity 2 • Choose four tools. Complete one precise justification per row.

Tool	Intended function	Specific control

LOOK CLOSELY

2.3 Sewing-machine safety

Prepare, guide, observe, stop: control matters more than speed.

A sewing machine forms stitches quickly using a moving needle and feed mechanism. The operator's job is to guide the fabric with control. Pulling fabric interferes with the feed and can produce uneven work. Keep fingers clear of the needle and presser foot, sit steadily, and sew only at a speed you can manage.

Preparation depends on the actual machine. Threading routes, bobbin setup and controls can differ between models, so use the teacher's demonstration for your assigned machine. A tutorial may explain the broad idea without matching the equipment in front of you. Do not combine remembered steps from several machines or guess how to fix a fault.

Switch the machine off when it is not in use and before teacher-approved adjustments, following the demonstrated procedure. Stop immediately if the sound changes, stitches form abnormally or the machine moves unexpectedly. Keep your hands away from the moving parts and ask for help. A small fault is easier to investigate before it becomes a damaged needle, fabric or machine.

Worked example • respond to a fault If a thread tangle appears while practising, the next useful action is to stop and switch off as directed. Pulling hard or sewing faster does not diagnose the cause. The teacher helps identify the correction before work resumes.

Explain a safe machine routine in three stages: prepare, operate and stop. Include the response to an unfamiliar sound.

Stage	Control / action	Why it matters
Prepare		
Operate		
Stop / unfamiliar sound		

KNOWLEDGE CHECK

Studio check · safe work

Recognise the reason for a control, then apply it to your room.

4. A student spots a frayed machine cord before starting. What should happen?

- ☐ A. Try the machine at low speed.
- ☐ B. Cover the damage and continue.
- ☐ C. Leave it unused and report it to the teacher.
- ☐ D. Ask another student to test it.

5. Which explanation shows correct tool selection?

- ☐ A. Use fabric shears on paper to save time.
- ☐ B. Use a seam ripper for unwanted stitches, following the demonstrated method.
- ☐ C. Use an iron to remove pins hidden in a seam.
- ☐ D. Use a pin to clear a running machine.

6. The fabric begins to drag and stitches look uneven. What is the best response?

- ☐ A. Stop and seek help; guide rather than force the fabric.
- ☐ B. Pull harder from behind the needle.
- ☐ C. Increase speed to smooth the seam.
- ☐ D. Keep sewing until the fabric tears.

Activity 2 · Audit your room before practical work. Record five hazards and the matching current controls. Use teacher guidance; do not create hazards to photograph them.

Hazard and possible harm	Current control

DRAW / EXPLAIN

3.1 Colour communicates

Colour choices need a reason, a context and a real fabric test.

Colour can attract attention, organise a design and create contrast. It can also suggest associations. A colour may remind one audience of the environment and another of a sports team. Culture, age, fashion, experience and context affect interpretation, so colours do not have one fixed meaning that everyone shares.

A palette is a selected group of colours used together. A limited palette can make a hat feel coherent because each colour has a clear role. One might provide the main fabric colour, another might help a symbol stand out, and a third might connect the two sides. Choosing several colours without a purpose can make a message harder to follow.

Contrast describes a noticeable difference. If a symbol blends into its background, its meaning may disappear even when the drawing is strong. Judge the whole design at the size and distance where it will be seen. Also compare actual fabric samples: a screen image, printout and dyed textile can look different.

Worked example • explain the role For an original repair message, a designer could choose a quiet background and a contrasting stitched motif. The useful explanation is how the motif stays visible, rather than claiming one colour always means repair.

Figure 4. Illustrative comparison: a similar leaf motif has lower contrast at left and higher contrast at right. Meaning still depends on audience and context.

Create a three-colour palette. Label each colour's role and explain how the colours work together for your message.

Colour 1	Colour 2	Colour 3

DRAW / EXPLAIN

3.2 Symbols and imagery

A simple form can carry a strong idea when its meaning is considered.

A symbol is a visual form that carries an idea. Imagery can be literal, such as a recognisable leaf; abstract, such as a repeated curved line; or pattern-based, with shapes repeated across a surface. The best choice depends on the message, audience and the way the hat will be made.

Research a symbol's meaning and ownership before adopting it. A familiar-looking mark may belong to a campaign, organisation or particular community. Avoid stereotypes and do not assume that changing a small detail grants permission. When the meaning or permission is uncertain, seek teacher guidance and develop an original direction.

Scale changes what an audience can read. Tiny lines may disappear when a design becomes a stitched or cut fabric motif. Appliqué needs manageable shapes and edges; a design with many hairline details may be difficult to translate. Prototype the idea at its intended size before putting it onto final fabric. This tests whether the technique, placement and imagery can work together.

Worked example • simplify with a purpose An original leaf motif with many fine veins could be simplified to a clear outer shape and one strong line. The designer preserves the idea while making it easier to recognise and produce.

Sketch an original symbol for your message. Annotate its meaning, intended technique and one simplification that helps it read on fabric.

WORKED EXAMPLE

3.3 Analyse before you design

Separate what you can see from what you think it means.

Analysis is more than saying that an image looks good. Start with observable features: colours, shapes, words, placement and material. Then interpret how those features could influence an audience. Finally, identify what you still need to know. Keeping these stages separate helps you avoid presenting a guess as evidence.

See-Think-Wonder is a useful routine. “See” records something visible or explicitly described. “Think” explains a possible meaning supported by that observation. “Wonder” asks a question that further research or audience feedback could answer. A different interpretation is worth discussing when it is tied to evidence.

Campaign analysis also asks who the message is for, what it wants people to do and how it attracts attention. Learn from its design decisions without copying its branding. Your hat has a curved, wearable surface, so a message that works on a large poster may need a different scale or placement on fabric.

Two classroom campaign examples • imagined Campaign A places “Mend it. Wear it again.” above a photograph of a visibly repaired shirt, with generous space around both. Campaign B places “Love it longer” below a close-up photograph of a repaired seam. These practice examples offer different approaches to a similar cause; neither is an existing campaign to copy.

Activity 3 • Compare the two examples. Record features, a possible audience effect and a useful question.

Thinking stage	Comparison of A and B
See: observable features	
Think: possible meanings	
Wonder: a question	

Which campaign would more clearly encourage your classmates to repair clothing? Judge it using the described features, and identify one limitation of your judgement.

KNOWLEDGE CHECK

Studio check · visual meaning

Use evidence to choose a message direction.

7. Two audiences interpret the same purple fabric differently. What should the designer do?

- ☐ A. Declare one audience wrong.
- ☐ B. Assume the fabric cannot communicate.
- ☐ C. Add every available colour.
- ☐ D. Consider context and test the message with the intended audience.

8. A delicate symbol loses detail when cut as appliqué. Which revision best fits the problem?

- ☐ A. Make the lines thinner.
- ☐ B. Ignore the sample and use the final fabric.
- ☐ C. Simplify the shape and test it at the intended size.
- ☐ D. Replace all research with a logo download.

9. Which sentence is an interpretation supported by evidence?

- ☐ A. I can see the word “mend”.
- ☐ B. The repaired-shirt image may encourage longer clothing use.
- ☐ C. The campaign definitely changed everyone’s habits.
- ☐ D. Every viewer will want a purple hat.

Activity 3 · Bring your palette, symbol and analysis together. Describe the message, audience, visual choices and how you will check whether the intended meaning is understood.

Record three inspirations used in your message or mood board. Identify each source, explain its design role and note a reuse boundary or check. Label any planned source honestly.

Item + where it came from	Role in my design	Reuse boundary / check

READ / OBSERVE / APPLY

4.1 Design situation, need and user

Understand the situation before proposing the hat.

A design situation explains the context for a project. It tells us what is happening, who is involved and why a designed solution could help. The need is the problem or opportunity inside that situation. The user is the person or group who will wear or use the product. These ideas are connected, but they do different jobs in a design record.

For Bucket Hat for a Cause, the situation might involve a school group wanting to communicate an issue through something wearable. The need is more specific than “make a hat”: the product must respond to that group, its purpose and the circumstances of use. Ask what the user already does, values or finds difficult before making a visual decision. Consider physical fit, emotional associations, practical use and communication needs.

Research may include respectful observation, reliable background information and questions directed by the teacher. Record where an idea came from and separate a genuine user comment from your own assumption. You can start with a possible need, then refine it as evidence grows.

Worked example • separate the ideas Situation: a garden club is sharing a waste-reduction message. User: a club member wearing the hat during school activities. Need: a comfortable, wearable way to communicate that message. The proposed solution can now be judged against something more useful than personal taste.

Describe your design situation, intended user and need in separate sentences. Identify one assumption you should investigate.

User investigation • Separate what you know from what you assume. If evidence has not been collected, say so and name the next source or question.

Record type	Your evidence or next action
Evidence + source	
Assumption to check	
Next investigation	

READ / OBSERVE / APPLY

4.2 A useful design brief

Write a guide for decisions, not a prediction of every detail.

A design brief states what you intend to develop and why. It names the product, user and purpose, and identifies the main requirements and boundaries. A good brief is focused enough to guide decisions but open enough for you to explore more than one possible design. If it specifies every colour and stitch before research, it may close down useful thinking.

The brief should connect back to the situation and need. In this unit the product is a reversible bucket hat. Its function and message need to work together: it should be wearable, suit the intended audience and communicate a chosen cause respectfully. Practical decisions must fit the teacher-approved pattern, materials, equipment and time available.

Use clear verbs such as design, develop, make and evaluate. Avoid vague promises such as “make the best hat”. You will need evidence to judge the result, so name the main qualities you intend to investigate. Do not invent an exact deadline, fabric quantity or school rule merely to make the brief sound complete.

Worked example • a focused brief Design and make a reversible bucket hat for a school garden-club member that communicates reducing waste through an original visual message. Develop comfortable, wearable ideas within the approved pattern and classroom processes, then evaluate them using agreed criteria.

Write your own brief. Include product, user, cause, intended qualities and the practical boundaries your teacher has confirmed.

Edit for clarity • A draft says, “Make the best bucket hat for everyone.” Identify two vague phrases, explain what each leaves unclear, and replace each with a more useful phrase.

Vague phrase	What is unclear?	Your clearer replacement

WORKED EXAMPLE

4.3 Criteria and constraints

Know what success looks like, and what limits the work.

Criteria for success are qualities you will use to judge the finished design. They might concern fit, reversible function, message clarity, construction quality or suitability for the audience. A useful criterion suggests an evidence check. “Looks good” is difficult to judge consistently; “the intended user can recognise the main motif” leads to a question you can investigate.

A constraint is a boundary within which you work, such as the approved pattern, available materials, time or permitted equipment. A constraint does not automatically describe quality. Having only the teacher-supplied fabric is a material boundary; making a durable product from it is a quality aim. Distinguishing these ideas helps you explain choices honestly.

Write criteria early and use them while developing ideas. At evaluation, compare the real product with each one and record what you actually observed. If something cannot be tested, explain the limitation instead of inventing evidence. Confirm practical boundaries with your teacher, particularly where a website example differs from your class.

Activity 4 • Create four criteria and pair each with a realistic evidence check.

Criterion for success	Evidence/check

Record three confirmed constraints, or clearly label any boundary that still needs teacher confirmation.

KNOWLEDGE CHECK

Studio check · the challenge

Make the brief, criteria and evidence fit together.

10. Which sentence describes a design need?

- ☐ A. Club members need a wearable way to communicate their message.
- ☐ B. The hat must use the approved pattern.
- ☐ C. The school cupboard contains fabric.
- ☐ D. The designer likes purple.

11. Which brief leaves useful room for development?

- ☐ A. Make an amazing hat.
- ☐ B. Copy one existing campaign hat exactly.
- ☐ C. Develop a reversible hat for a named user and cause within confirmed boundaries.
- ☐ D. Choose every final detail before researching the user.

12. Which pair correctly connects a criterion and a check?

- ☐ A. Available lesson time → ask whether the motif looks good.
- ☐ B. Only use the approved pattern → count colour preferences.
- ☐ C. It must be perfect → say that it is perfect.
- ☐ D. Readable symbol → ask the intended audience what they recognise.

Activity 4 · Re-read your brief and criteria. Explain how one criterion responds to your user's need, and revise any vague wording.

What is the most important unanswered question about your brief or constraints? State who or what can provide the evidence.

DRAW / EXPLAIN

5.1 Mood boards with direction

Collect evidence of a visual direction, then explain the connections.

A mood board brings selected images, colours, textures and words together to explore a design direction. Its value lies in the relationships between the choices. A crowded collection of favourite pictures may be attractive but tell you little about the intended hat. Choose material that helps you decide how the cause, audience and product could connect.

Start with the brief. Look for a shape, colour relationship or texture that supports it, and add a short note explaining why it belongs. Keep a source record for anything collected. Studying a campaign's use of contrast can be useful; reproducing its protected logo is a different action. Use respectful research and develop original imagery.

A mood board is a starting point for concepts, not proof that a design will work. Real fabric, scale and technique trials will test your choices later. Remove an attractive item if it pulls the design away from the message. This editing makes the board a tool for thinking rather than a decoration.

Example • connect the selection For a waste-reduction message, a fabric remnant might suggest useful texture while a clear line drawing suggests a readable motif. Notes explain these roles; they do not claim the samples are the final product.

Figure 5. Illustrative mood board: fabric, palette and drawn forms suggest a direction. Record the reason for each item you select.

Activity 5 • Build a small mood-board plan using sketches, colour names, words or suitable pasted samples. Annotate how each choice supports the brief; record sources on page 14.

DRAW / EXPLAIN

5.2 Distinct annotated concepts

Explore three genuinely different ways to communicate your message.

A concept sketch tests a possible solution. Make the alternatives different in a useful way: change the motif, placement, colour relationship or decorative approach. Three copies with tiny changes give you little to compare. Keep the same brief so the alternatives can be judged fairly.

Annotations explain decisions that a sketch cannot show by itself. Label the intended fabric or technique, describe the message, and show how the two sides relate. These are proposals until the teacher confirms materials and processes. Draw clearly enough to discuss the idea; a concept does not need to look like a finished photograph.

Activity 5 • Draw three distinct hat concepts. For each, annotate message, colour, technique, user benefit and the second-side idea. Use the space below each sketch for notes.

Concept A	Concept B	Concept C

WORKED EXAMPLE

5.3 Feedback, PMI and final choice

Choose the strongest direction by explaining the trade-offs.

A final choice should follow a comparison, rather than simply being the first sketch you liked. Use the brief and criteria to judge your concepts. Think about whether the message is readable, whether the design suits the user and whether the intended materials and techniques can work within the confirmed boundaries.

PMI stands for Plus, Minus and Interesting. A plus is a useful strength. A minus is a limitation or problem. An interesting point is something worth exploring further. The same feature can have more than one effect: a bold motif may be easy to recognise, while its placement could interfere with a curved seam. Explain why each point matters.

Feedback is useful when it refers to the design and its purpose. Invite a peer to describe what they understand, then record the comment accurately. You do not have to accept every suggestion. Compare it with evidence and decide whether to keep, adapt or reject it, with a reason. A thoughtful revision is evidence of design development.

Example • move from comment to decision A peer says the motif may disappear against the fabric. The designer checks a sample, strengthens the contrast and records the reason. The revision responds to the message criterion, rather than merely adding more decoration.

Activity 5 • Compare Concepts A, B and C using PMI. For each, explain a strength, a limitation and an interesting possibility to investigate.

Concept	Plus: strength	Minus: limitation	Interesting: investigate
A			
B			
C			

KNOWLEDGE CHECK

Studio check · select and refine

Turn three ideas into a reasoned design direction.

13. What makes a mood board useful for this project?

- ☐ A. It contains the largest possible number of pictures.
- ☐ B. Its selected colours, shapes and textures are explained against the brief.
- ☐ C. It supplies a finished hat to copy.
- ☐ D. It proves every technique will work.

14. Which set offers the strongest concept exploration?

- ☐ A. Three identical hats with different titles.
- ☐ B. One concept copied three times.
- ☐ C. Three unrelated products without a common brief.
- ☐ D. Three hat ideas with different visual approaches to the same message.

15. A peer likes Concept B, but gives no reason. What is the best response?

- ☐ A. Ask for a specific comment and compare it with your criteria.
- ☐ B. Select B because all feedback is an instruction.
- ☐ C. Discard all feedback permanently.
- ☐ D. Change the brief to avoid comparison.

Activity 5 · Record one real peer comment about your concepts. Explain how it connects to a criterion; if feedback is not yet available, write the question you plan to ask.

Select A, B or C. Justify your choice using the brief, PMI and available feedback, then identify one refinement to test.

READ / OBSERVE / APPLY

From fibre to fabric

6.1 Fibre, yarn and fabric

A fibre is a fine strand. Cotton fibres come from a plant; polyester fibres are manufactured. Fibres can be combined into yarn, and yarn can be made into fabric. Naming these levels helps you explain why a finished cloth behaves as it does.

In a woven fabric, yarns interlace in different directions. In a knitted fabric, yarn forms interlocking loops. Woven cloth often gives stable pattern placement; knitted cloth usually stretches more. These are useful tendencies, not proof that every sample behaves identically.

Fabric can also be made by bonding fibres into a nonwoven structure. The important idea is that the final structure matters. Two fabrics with the same fibre name may differ in thickness, surface, flexibility and strength because their yarns, structure or finish differ.

For a bucket hat, stable pieces help edges and matching marks meet as intended. Stretch can change a shape while you handle it. Use the actual approved pattern and materials, inspect the sample, and explain a property's effect on fit, cutting or construction before making a choice.

Figure 6. Illustrative sequence: loose cotton fibres, spun yarn and woven fabric. Observe the change from separate strands to an organised textile structure.

Explain fibre → yarn → fabric. Link woven or knitted structure to one need of the hat.

READ / OBSERVE / APPLY

Choose fabric for its behaviour

6.2 Cotton and polyester

Cotton is a natural plant fibre. It is valued for absorbency, comfort and its ability to take suitable dyes. Those properties can support a hat worn close to the skin and a design that uses colour in the cloth. Cotton can also crease. A useful material decision names both a benefit and a trade-off.

Polyester is a manufactured synthetic fibre. It is often quick drying, strong and resistant to creasing. These can be useful properties for repeated wear and care. They do not tell you how every polyester cloth feels or how a particular dye will behave.

A fibre name is only part of the evidence. Yarn, weave, thickness and finish affect drape, handle and performance. Handle means the way a fabric feels when touched; drape describes how it hangs or bends. Compare the actual approved samples rather than judging from a photograph.

Blends combine fibres to balance properties. For this reversible hat, compare comfort, construction, care and the decorative process. A cotton-rich sample might support an approved dye trial, but the teacher must confirm the fabric and process. Record what you observe and what still needs testing.

Figure 7. Illustrative material study. Surface texture invites comparison; appearance alone does not verify fibre content or performance.

Compare two approved samples. Name a benefit, a trade-off and one further test for your hat.

WORKED EXAMPLE

Look beyond a green label

6.3 Sustainability needs evidence

Sustainability considers environmental, social and economic effects across a product's life. Raw materials, manufacturing, transport, use, care and end of life all matter. A natural or recycled label gives one piece of information. It does not show the complete history of a cloth.

Consider an illustrative claim: "This hat is sustainable because its fabric is natural." The claim gives no evidence about production, working conditions, care or how long the hat lasts. A stronger judgement names what is known, explains its relevance and admits what remains unknown.

A more careful claim "I checked two permitted layouts before cutting. The selected layout leaves larger usable remnants, which we can retain for trials. I have not measured the material's manufacturing impacts." This is a bounded claim based on a real action, if that action occurred.

Durability can extend useful life and reduce the need for replacement. Accurate cutting, secure construction and appropriate care may support that aim. Care itself uses resources, so follow the actual fabric and process guidance rather than inventing washing instructions. Keep suitable remnants as directed and avoid wasteful repeat trials caused by poor records.

For production, use/care and end of life, name one question you would investigate before judging a fabric's sustainability.

Life-cycle stage	Question to investigate
Production	
Use and care	
End of life	

Write one specific action you can take in this project and the evidence you would collect.

KNOWLEDGE CHECK

Check your material reasoning

Circle one answer for each question, then apply the learning.

16. Two cotton fabrics bend differently. What is the strongest explanation?

- ☐ A. Cotton always has one fixed handle.
- ☐ B. Yarn, structure and finishing can differ.
- ☐ C. Colour alone determines drape.
- ☐ D. One fabric must be polyester.

17. Which observation is most useful when selecting cloth for an approved dye process?

- ☐ A. The roll has the lowest price.
- ☐ B. The label uses a green leaf icon.
- ☐ C. A friend likes the shade.
- ☐ D. A supervised trial shows the intended result on the actual fabric.

18. Which statement makes the most careful sustainability claim?

- ☐ A. This layout uses fewer offcuts; other impacts still need evidence.
- ☐ B. Natural fibre has no environmental impact.
- ☐ C. Recycled content makes every stage sustainable.
- ☐ D. A green hat always saves resources.

Choose one action to reduce waste and one to extend the hat’s useful life. Explain a limitation in your evidence.

Use your sample comparison on page 24 to organise the evidence. Write “not tested” where needed.

Need	Cotton sample	Polyester sample
Comfort		
Making		
Care		

WORKED EXAMPLE

Make a trial you can learn from

7.1 Sampling before production

A sample is a controlled trial made before the final product. It lets you investigate colour, scale, attachment, stiffness or handling while protecting the final hat pieces. Use the actual or a comparable approved fabric so the result relates to your intended design.

Begin with one question. For example: “Will a simpler appliqué shape make the motif easier to recognise?” Keep the fabric, overall motif size and approved attachment process consistent while changing the shape’s detail. If fabric, thread, size and technique all change, you cannot tell which change caused the result.

Worked trial plan Hypothetical trial: a detailed leaf loses its small points at hat scale. A second sample keeps the same size but simplifies the outline. Compare clarity, edge security and fabric movement. Record the result, including any remaining weakness.

A useful log records the technique, materials, demonstrated process, actual observations and next change. Record settings only from your supervised work. A neat photograph does not show adhesion or comfort by itself; include the relevant teacher-approved observation or test.

Plan your own fair trial. State the question, fabric, one change, what stays the same and how you will judge success.

Trial decision	My plan
Question	
Approved fabric	
One change	
Keep the same	
Judge success	

Record what must be demonstrated or approved before the trial begins.

LOOK CLOSELY

Build a message with stitches

7.2 Appliqué, embroidery and couching

Figure 8. Illustrative trial comparison. The shaped fabric is appliqué; the dyed cloth changes colour within the fabric. These are examples to inspect, not records of your trials.

Appliqué attaches a shaped fabric layer to a base. A bold silhouette can remain readable at the scale of a hat. Its edges and attachment need attention: an attractive shape that lifts during handling has not yet demonstrated durability.

Embroidery builds imagery with decorative stitches. It can add fine detail, but a very dense area may stiffen lightweight cloth. Couching holds a thicker thread or cord on the surface with smaller securing stitches, creating a raised line. The cord and its holding stitches have different jobs.

Choose the technique by the message, fabric, scale and approved process. In an illustrative leaf design, a broad appliqué shape may establish the outline while a few embroidered stitches suggest veins. Test the proposed combination on a separate sample before committing the final pieces.

Technique check Inspect the edge, surface and bend of a sample. A technique must suit the fabric's movement as well as its appearance.

Compare two stitched techniques for one original motif. Justify your preferred technique and a trial check.

READ / OBSERVE / APPLY

Colour the surface with purpose

7.3 Stencilling, dyeing and transfers

Stencilling applies colour through a controlled opening. A secure stencil and controlled application can help maintain clear edges. Too much colour or movement can cause bleeding. The sample should show whether the result stays readable at the size and position planned for the hat.

Dyeing changes colour in suitable fibres or fabric through an approved process. Fibres accept dyes differently, so a result on one cloth cannot guarantee the same result on another. Follow the specific product and teacher instructions. Do not assume that ironing alone makes every dyed fabric colourfast.

A heat transfer bonds a prepared design to fabric using an approved heat process. Fabric suitability, equipment and settings matter. Heat, dyes, paints and cutting tools each introduce particular risks. Use the demonstrated protective controls and ventilation; do not copy an unverified recipe or combine products.

Judge more than brightness. Look for bleeding, stiffness, attachment, colour change and durability under the teacher-approved check. A crisp design may still make the brim uncomfortable. Record the evidence and select a precise next change before decorating final pieces.

Use a real supervised sample, or label this as a planned check. Record Plus, Minus, Interesting and the next change.

Sample reflection	Evidence or planned check
Plus	
Minus	
Interesting	
Next change	

Keep the evidence Keep a separate labelled sample or photograph with this entry. Write the technique and stage so the evidence can be located later.

KNOWLEDGE CHECK

Select a technique with evidence

Circle one answer for each question, then compare your trials.

19. A second trial changes fabric, thread, size and stitch method. What is the main problem?

- ☐ A. It uses too little colour.
- ☐ B. It must be more accurate.
- ☐ C. You cannot identify which change caused the outcome.
- ☐ D. It cannot be photographed.

20. Which description identifies couching?

- ☐ A. Smaller stitches hold a thicker cord on the surface.
- ☐ B. A stencil opening controls paint.
- ☐ C. Dye changes a suitable fibre's colour.
- ☐ D. Two fabric edges form a construction seam.

21. An attractive transfer makes the brim too stiff. What should the designer do?

- ☐ A. Ignore the problem because the image is clear.
- ☐ B. Reconsider scale, placement or process and make an approved trial.
- ☐ C. Increase heat without checking.
- ☐ D. Change the assessment criterion to suit it.

Compare two trial records. Name the process, observed result and refinement for each; select one for your design.

Trial and process	Observed result	Refinement and selection
Trial 1		
Trial 2		

LOOK CLOSELY

Read the pattern before cutting

8.1 Pattern pieces and symbols

A pattern communicates shapes and assembly information. Grainline, fold, cutting lines, notches and placement marks each have a purpose. Read the symbols on the actual teacher-approved pattern. A workbook sketch or a source photograph cannot establish the full-size shape or seam allowance.

Start by identifying every piece and its required quantity. Match the pattern version to the current instructions, then find the grain or fold direction, matching marks and fabric side. Keep labels with cut pieces so the two reversible sets remain clear. If a symbol or count is unclear, stop before cutting.

Figure 9. Authentic source photo: shaped brim components.

Figure 10. Authentic source photo: round crown components.

Pattern authority The source guide's piece-count wording is inconsistent with its images. Your issued pattern and teacher confirmation control the count; do not count pieces from these photographs.

Record your pattern version, piece names and quantities, symbols to transfer, and any question needing teacher confirmation.

INVESTIGATE / APPLY

Plan the layout before the cut

8.2 Layout, marking and cutting

Fabric preparation affects every later join. Identify right and wrong sides as demonstrated and orient pattern pieces to the approved grain or fold symbols. Arrange complete pieces efficiently without unauthorised overlap. Saving a narrow offcut is not a success if the grain direction or shape is wrong.

Secure the pattern using the approved method. Transfer only the required construction marks: extra marks can confuse a later join or remain visible. Cut smoothly with the fabric supported, then label and organise each reversible set. Jagged or inaccurate curves can produce mismatched edges and poor shape.

A layout trade-off Illustrative mistake: a student rotates one piece to fill a gap without checking its grainline. The layout may save cloth but change behaviour. Check orientation first, then compare only permitted layouts.

Sketch a possible layout from your issued pattern. Show the fabric edge or fold, grain direction, piece identities and usable remnants. Do not use this sketch as a cutting template.

Write an ordered checklist from approval to labelled cut pieces.

PROJECT FOLIO

Show machine readiness

8.3 Machine readiness and practice

Machine readiness is demonstrated on the actual classroom machine. Identify its parts so you can follow instructions and report a problem precisely. Threading, bobbin setup and checks must follow the teacher's demonstrated path for that model. A different online machine is not an interchangeable guide.

Use approved sample fabric to practise straight lines, curves, stopping, pivoting and securing as directed. Guide the cloth while the feed system moves it; pulling can interfere with stitch formation. Work at a controllable speed with fingers clear of moving parts. Switch off for approved adjustments and when not in use.

A sample shows where control is developing. Record uneven spacing, a wandering line or another visible outcome. Thread nests, skipped stitches, needle damage or abnormal sound mean stop and seek help. A practice record supports the teacher's readiness decision; it is not a sewing licence by itself.

Attach or sketch your actual practice sample. Label one controlled feature and one improvement. If practice has not occurred, label this as a plan.

Record the evidence, teacher feedback and next practice action. Write your current approval status.

KNOWLEDGE CHECK

Check production readiness

Circle one answer for each question, then identify the next safe step.

22. The photo and pattern appear to show different quantities. What controls cutting?

- ☐ A. The image with more pieces.
- ☐ B. The fastest online tutorial.
- ☐ C. A guess based on both sources.
- ☐ D. The issued approved pattern and teacher clarification.

23. A grainline is unclear in a proposed layout. What should happen first?

- ☐ A. Rotate the piece until it fits.
- ☐ B. Clarify orientation before marking or cutting.
- ☐ C. Cut a larger piece without asking.
- ☐ D. Ignore it if the colour looks right.

24. Your machine forms a thread nest. Which response shows readiness?

- ☐ A. Pull the fabric harder.
- ☐ B. Change several settings at once.
- ☐ C. Stop and seek help using the demonstrated routine.
- ☐ D. Continue until the seam is complete.

For each stage, record evidence and whether you can proceed, must correct something or need to ask.

Stage	Evidence or question	Proceed / correct / ask
Pattern		
Cut pieces		
Machine		

Next step Resolve uncertainty while the work is still reversible. Record the teacher's direction accurately and update your plan.

WORKED EXAMPLE

Plan the next practical stage

9.1 Action plan and workflow

An action plan orders work and identifies resources, checks and evidence. It helps you arrive prepared for the next stage and protects time for setup, production, checking, recording and pack-up. A list that uses the whole lesson for sewing overlooks essential work.

Use the current teacher-approved construction sequence. The course's Joanne Dennis guide shows preparation, interfacing, side seams, brim and crown assembly, joining two hats, turning and finishing. Its pictures do not establish a universal order or setting. Confirm the applicable stages for your pattern before writing the plan.

Worked example with a planned stage

Task	Prepare	Check	Record
Organise pieces before assembly	Approved pattern, labelled pieces and required tools	Correct identities, quantities, marks and matching sets	A labelled layout photo plus any teacher clarification

This plan names what needs to be ready and what evidence will show readiness. It does not claim the task is complete. If an approved correction takes longer than expected, update the plan and explain the change. Do not hide a delay by marking the original plan as finished.

Plan your next three practical stages. Include resources, a safety check, a quality check and evidence for each.

Stage and resources	Safety and quality checks	Evidence to collect

LOOK CLOSELY

Prepare parts that will meet

Construction guide study

The authentic guide begins with cutting, applying interfacing and sewing side seams. Interfacing is a supporting material that changes the structure of the area where it is applied. Use the specified pieces, material side and demonstrated method; an image does not supply adhesive or heat settings.

Before each join, identify the pieces and the faces that must meet. The guide uses right sides together at relevant joins so the finished surfaces face each other during sewing. Seams are then pressed as directed. This is an orientation instruction, not permission to guess the seam allowance.

Figure 11. Authentic source photo: clips hold matching components.

Figure 12. Authentic source photo: an opened seam being pressed.

A hold point is a deliberate pause before work becomes harder to correct. Check part identity, edge alignment, orientation and the teacher-approved next step. If pieces do not meet, stop and compare them with the pattern. Pulling one piece into place may conceal an earlier cutting or matching error.

Explain why “right sides together” and “press the seam” answer different construction questions. Name one check before joining.

LOOK CLOSELY

Control the curved joins

9.2 Construction quality

Curved edges require accurate preparation and controlled feeding. Use the approved matching marks to distribute the pieces as demonstrated. Check that the correct edges meet without twisting or forced stretching. Keep fingers clear, work at a speed you can control and let the feed mechanism move the fabric.

Figure 13. Authentic source photo: crown components and edge marks.

Figure 14. Authentic source photo: a curved assembly held with clips.

The guide contains titled stages for attaching the brim and sewing the crown. One brim-stage photograph already shows a closed crown, so images alone do not establish the complete order. Follow the teacher-confirmed sequence for your pattern. Do not combine incompatible steps from different demonstrations.

Puckering, a twist, mismatched seams or poor feeding is a reason to stop. Describe what you can actually see, then diagnose the cause with the teacher. A correction might address alignment or an earlier preparation error; it should be checked before further sewing hides the area.

A curve puckers and its marks no longer meet. Write an observe → stop → diagnose → act → recheck response.

LOOK CLOSELY

Finish both visible sides

Joining, turning and final checks

A reversible hat has two sides that may be worn outward. In the guide, the two hat assemblies are joined right sides together, with an opening left for turning. The pattern and demonstration control the opening's position and size. Do not close every seam before checking how the product will turn.

The guide then shows turning, pressing, rows of topstitching and closing the remaining opening. Topstitching is visible stitching on the finished surface. Its placement and spacing follow the approved process. Press only with the correct material, settings and teacher controls; heat is not a universal guarantee of dye permanence.

Figure 15. Authentic source photo: visible rows of topstitching.

Figure 16. Authentic source photo: the contrasting finished appearance.

Check the whole product in both orientations. Look for trapped fabric, twists, exposed unfinished edges and uneven areas, then use the agreed fit and comfort checks. A source photo can clarify appearance, but only your actual hat and recorded observations can establish your result.

Explain why the turning opening matters, then list three checks you would make after reversal.

PROJECT FOLIO

Record what actually happened

9.3 Progress evidence

Progress evidence shows change over time. A useful entry names the date or stage, what was completed, a quality observation, a problem or decision and the next action. A clear photograph helps when it shows the relevant detail, but a photograph without a caption may leave the important reasoning invisible.

Compare “worked on hat” with this hypothetical entry: “After joining the side seam, I noticed uneven alignment. I stopped and checked with the teacher. The correction improved the match; next I need the approved check before the curved join.” The second entry makes the observation and response visible.

Use your own project evidence. Keep student faces, names and private information out of process photographs. Source images in this book illustrate construction; they cannot prove that you completed a stage. If work has not happened, describe a plan and identify the evidence still needed.

Record one real stage below. Attach or sketch the relevant detail, then explain the quality observation and next step.

Write the stage, observation, response and next action.

KNOWLEDGE CHECK

Check the making decisions

Circle one answer for each question, then diagnose a possible fault.

25. An action plan changes after an approved correction. What is the best record?

- ☐ A. Update the stage and explain the reason.
- ☐ B. Leave the original completion tick.
- ☐ C. Remove the evidence of the fault.
- ☐ D. Change the user's need to match it.

26. A photo seems to contradict the written stage order. What should you do?

- ☐ A. Copy whichever looks easier.
- ☐ B. Combine both methods.
- ☐ C. Infer a missing seam allowance.
- ☐ D. Confirm the sequence against the actual pattern and teacher demonstration.

27. Which progress entry gives the strongest evidence?

- ☐ A. Finished lots of work.
- ☐ B. My hat is perfect.
- ☐ C. Brim alignment checked; one area needs correction before the next join.
- ☐ D. The source photograph looks good.

A hat turns successfully but shows an unfinished edge on one side. Explain the failed requirement, your safe next action and the evidence to record.

Honest evidence A clear record of a problem can show strong learning. Accuracy matters more than making every entry sound successful.

WORKED EXAMPLE

Turn a result into a judgement

10.1 Test against criteria

Evaluation compares the actual hat with its brief and criteria. A description says what exists; a judgement explains how well a requirement was met. Fit, comfort, reversibility, message clarity and construction may lead to different conclusions. Test each relevant criterion separately.

Worked example with hypothetical evidence

A designer's criterion is that the original motif is recognisable on both sides of the hat. In a planned audience check, viewers identify the leaf on side A, but confuse the small stitched shape on side B. These invented results illustrate reasoning; they are not your project evidence.

Follow the reasoning Criterion: recognisable motif on both sides. Evidence: one side is recognised and the other is confused. Judgement: partly met. Improvement: simplify and enlarge the side B motif, then repeat the same approved check.

The response links a specific change to a specific weakness. "Make it better" gives no direction. An improvement is a proposal until tested, so do not claim the new motif will definitely work. State any evidence you did not collect, including missing user feedback.

Repair this evaluation: "My hat looks great, so every criterion passed." Use a different criterion and clearly hypothetical evidence.

Evidence record Your own final criterion checks belong on page 50. Record actual results there, including a limitation or an unperformed test.

Figure 17. Illustrative communication study. A clear motif must be considered together with the hat's form, fabric and reversible use. The image cannot establish comfort or audience response.

READ / OBSERVE / APPLY

Use feedback to improve decisions

10.2 Feedback and reflection

Another person may read the hat differently from its designer. Structured feedback asks what works, what could improve, what is interesting and what next step is realistic. A specific comment about a feature is more useful than a score or a general reaction such as “nice hat”.

The designer remains responsible for the response. Compare a suggestion with the brief, criteria, source evidence and approved construction. A peer might suggest a larger motif, but that change still needs a trial at hat scale. A request to copy a protected logo does not become appropriate simply because someone prefers it.

Reflection looks across the whole process. It identifies an earlier assumption, a new understanding and the evidence that caused the change. Problems are part of that story. Reseaming a trial may teach you why accurate cutting and controlled feeding matter; hiding the problem removes the evidence of that learning.

Keep feedback distinct from your own judgement. Record the comment accurately, decide whether to adopt, adapt or decline it, and explain why. If no feedback was collected, record the limitation and plan a teacher-approved opportunity to gather it.

Record specific feedback and decide how to respond. If none is available, label the entry as a planned question.

Comment or question	My response and evidence	Next action

Complete: I used to think ... now I think ... because Refer to one real experience.

READ / OBSERVE / APPLY

Explain the design journey

10.3 Designer statement and presentation

A designer statement helps an audience understand the choices behind the hat. Name the user, purpose and cause, then explain the important visual, material and technique decisions. Connect at least one choice to a trial or piece of evidence. A list of colours alone does not explain the design.

Present the reversible product clearly. Show both appearances and selected process evidence. Use honest, focused images of your own work without distracting filters or private details. The two source photographs below demonstrate why showing only one side leaves part of the product unexplained.

Figure 18. Authentic source photograph: one outward appearance.

Figure 19. Authentic source photograph: contrasting outward appearance.

End with a bounded judgement: what worked, what evidence supports it and what you would improve. A presentation may be written, spoken, video-based or another teacher-approved format. Formal marks, due dates and submission details come from the issued notification, not this workbook.

Draft a short statement: user and cause; one visual choice; one material or technique reason; one evidence-based judgement.

KNOWLEDGE CHECK

Check the final judgement

Circle one answer for each question, then prepare the presentation.

28. A hat reverses neatly but is uncomfortable. What is the best conclusion?

- ☐ A. Every criterion passed.
- ☐ B. Reversibility may succeed while comfort needs improvement.
- ☐ C. No useful evaluation is possible.
- ☐ D. The designer should remove the comfort criterion.

29. A peer suggests copying a campaign logo. What should guide your response?

- ☐ A. The loudest opinion.
- ☐ B. The number of colours.
- ☐ C. The shortest production time.
- ☐ D. The brief, originality, respectful use and evidence.

30. No intended-user feedback was collected. What belongs in the statement?

- ☐ A. An honest limitation and a proposed next check.
- ☐ B. A likely positive comment presented as fact.
- ☐ C. Another student's test result.
- ☐ D. A claim that feedback is unnecessary.

Plan what you will show and explain. Use your actual folio page or evidence reference.

Presentation element	My evidence or page	Still needed
Both hat sides		
Key design decision		
Trial or problem-solving		
Final judgement		

Before submission Finish the folio with evidence, not a promise of marks. Confirm the actual assessment notification and submission instructions with your teacher.

PROJECT FOLIO

Define your project clearly

Bring the strongest thinking from Modules 1–4 into one usable brief.

Name your intended user, their need, the cause and the setting in which the hat will be worn.

Write a focused brief for a functional, wearable, reversible bucket hat that communicates your cause.

Write four testable criteria. Explain why each matters and the evidence you plan to collect.

Criterion	Why it matters	Planned evidence

State three real constraints and how they affect your decisions.

PROJECT FOLIO

Refine the selected concept

Use your three concepts on page 20 and trial evidence to improve one direction.

Enlarge the selected motif or detail. Show the refinement, its position on the hat and the intended relationship between the two sides.

Identify the feedback or trial evidence that supports this refinement. Refer to your sample log or module page.

Explain a benefit and a possible trade-off. Name one check before applying the detail to final fabric.

Refinement focus A meaningful refinement changes something that matters to the user or making process. Explain the effect, not just the new colour.

PROJECT FOLIO

Communicate your final design

Show how the two visible sides work together.

Draw the complete hat from both sides. Label colour, motif, placement and the approved decorative technique.

SIDE A	SIDE B
	

Explain one decision that connects your user, cause and construction evidence. Identify any approval still needed.

Useful annotations Point each leader to one feature and explain its effect. Keep dimensions and pattern changes controlled by the teacher-approved pattern.

PROJECT FOLIO

Prepare the making plan

Keep the issued pattern, confirmed sequence and real approvals together.

Record the pattern version and teacher-confirmed quantities, orientation and construction instructions you will use.

Plan three major stages. Include materials/tools, checks and evidence. Cross-reference page 35 rather than copying if it is current.

Stage and resources	Checks before proceeding	Evidence / page

Record machine-practice status, technique approvals and any question that must be resolved before making.

Manage the session Leave time for setup, recording and safe pack-up. Revise the plan when the process changes, keeping the reason visible.

PROJECT FOLIO

Keep the progress evidence

Three real stages show how the product developed.

For each stage, add a small photo or observational sketch, a stage/date, a quality observation and the next action.

Photo or sketch	Stage / date	Quality observation	Next action

Explain one problem using observe → stop → diagnose → act → recheck. Refer to the relevant stage.

Evidence care Keep faces, names and private information out of photographs. Record what happened while the details are fresh.

PROJECT FOLIO

Evaluate and communicate the result

Use real evidence to judge the brief you wrote on page 45.

Evaluate all four criteria. State the method/result, judgement and specific improvement. Write “not tested” if needed.

Criterion	Method and result	Judgement and improvement

Record one piece of feedback and how you responded. Name evidence that changed your thinking.

Write your final designer statement. Explain the user, cause, choices, key challenge and evidence-based judgement. Refer to both sides of the real hat.

Final check: both hat appearances are recorded; sources are credited; missing evidence is identified; teacher submission requirements are confirmed.
