

Teacher guide

Answers, model reasoning and practical-source checks for the 50-page core workbook and its Practice & investigation companion.

Teach the decision, then check the evidence

The course follows five connected strands: specific food needs; culture and belief; lifecycle nutrition; allergies, intolerance and safer planning; and modified foods, fibre and support. Use the reading and worked example before the original written response and applied task.

Included	Coverage
Original knowledge-check key	150 questions; exactly three options per question
Extended-response support	15 original prompts and starters with authored model reasoning
Applied-task support	15 authored criteria sets plus complete fictional-stimulus solutions
Project folio	Eight stages with source prompts and authored checking criteria
Recipe verification	Nine source titles, unresolved defects and master-attachment record

Original source feedback is labelled explicitly. All model reasoning, criteria and fictional-data solutions are author-created formative guidance, not a formal marking scheme or practical sign-off.

Current student course: Year 9, Term 2, Stage 5 Food Technology. The 2027 v2 teacher program is an elective Stage 5 alignment and leaves the local cohort to the teacher. A historical 2024 program labels Year 10; this guide follows the current student site.

Edition 1.0 • Source snapshot: 28 September 2026 • A4 • Duplex long edge

TEACHING AND EVIDENCE BOUNDARIES

Using this guide

Keep the three evidence types distinct

Original knowledge-check feedback is reproduced verbatim from the site and applies to each question as a whole. The source does not provide a separate explanation for each distractor. Letter keys follow the original three-option order. Source runtime IDs such as m1s1q0 use a zero-based question index; printed question numbers begin at 1.

Authored response and activity criteria explain what a defensible answer should demonstrate. The detailed solutions refer to the companion's labelled fictional data. Accept supported alternatives within the supplied brief; do not accept an invented price, nutrient value, approval, trial result or local cultural permission.

Practical approval remains local

The nine recipe reproductions are supporting resources; none is a named compulsory recipe in the fifteen section tasks or eight folio stages. The v2 program makes its two practical periods conditional on teacher approval. Before cooking, attach a current checked recipe master and confirm the brief, labels, individual plans, equipment, supervision and school controls.

Paper planning can continue while a practical source is unresolved. Making and testing entries must describe actual authorised work, or be clearly labelled as simulation. Completing a folio does not certify competence or guarantee medical suitability.

Use the correct authority

Use fictional or authorised scenarios without collecting unnecessary private medical information. Local Aboriginal Cultural Knowledge requires appropriate local authority and permission. Individual clinical decisions belong with the treating team; school-controlled procedures belong with staff. Do not infer cultural or religious practice from a group label.

Suspected anaphylaxis requires immediate emergency action and Triple Zero (000), following the relevant emergency plan and school procedures. Do not delay urgent help for ordinary teacher approval, a worksheet, a website search or a test taste.

No current standalone puzzle route exists in this source. Its fifteen applied activities provide the sorting, ranking, auditing, planning, sketching and mapping practice.

CORE AND COMPANION ROUTES

Section answer navigator

Section / focus	Core	Key	Guidance
1.1 Circumstances that create specific food needs	3–4	4	5
1.2 Factors that shape food choices	5–6	6	7
1.3 Meal planning for a specific circumstance	7–8	8	9
2.1 Food taboos and cultural patterns	9–10	10	11
2.2 Religious and ethical food choices	11–12	12	13
2.3 Respectful investigation and evidence	13–14	14	15
3.1 How needs change across life stages	15–16	16	17
3.2 Adolescent nutrition and growth	17–18	18	19
3.3 Designing a lifecycle meal	19–20	20	21
4.1 Allergy versus intolerance	21–22	22	23
4.2 Labels, allergen risk and cross-contact	23–24	24	25
4.3 Planning food for a person with a diagnosed need	25–26	26	27
5.1 Nutritionally modified and fortified foods	27–28	28	29
5.2 Dietary fibre and adolescent needs	29–30	30	31
5.3 Support networks and evaluating reliable help	31–32	32	33

Core folio stages occupy pages 43–50. Teacher folio criteria follow the section answers. Recipe verification and official references complete this guide.

SECTION 1.1 • KEY AND CHECKING CRITERIA

Circumstances that create specific food needs

Core reading p. 3; original written response p. 4. Companion activity pp. 5.

Original knowledge-check answers

1. B — A diagnosed peanut allergy with an individual plan
Source feedback: A diagnosed need changes selection and preparation controls.
2. A — It does not identify the cause, boundary or authority
Source feedback: The actual requirement and its source must be verified.
3. C — Intolerance and allergy are different needs
Source feedback: Removing lactose does not necessarily remove milk proteins.
4. B — A toddler requiring age-appropriate texture
Source feedback: Age and development can change texture and nutrient priorities.
5. A — Who is the person and what has been verified?
Source feedback: Person-first planning prevents assumptions from driving the design.
6. C — The person's approved plan and appropriate professionals
Source feedback: Medical requirements need authoritative confirmation.
7. B — The label must be checked again at purchase
Source feedback: Ingredients and manufacturing information can change.
8. A — The consequence and personal boundary are different
Source feedback: The cause of the need determines the response.
9. C — Verified facts, assumptions and items to confirm
Source feedback: A useful plan records evidence without unnecessary personal data.
10. B — When the requirement or school control is unclear
Source feedback: Uncertainty at a safety boundary is a stop point.

Applied task: checking criteria

The four supplied cards classify as follows: diagnosed coeliac disease is Health or medical; personally observed religious fasting is Culture or belief; limited cooking equipment is Access or circumstance; choosing to avoid animal products is Ethical choice. The source supplies Lifecycle as an available category but no separate lifecycle card. Multiple influences may coexist, so accept a reasoned secondary classification without losing the main cause. Verification questions should address the actual requirement, authority and feasible response: approved medical information, the person's observance, available equipment or the individual's ethical boundary. Do not require medical disclosure. Coeliac disease is a medical need and should not be relabelled as a food allergy.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 1.1 • RESPONSE AND APPLIED SOLUTIONS

Circumstances that create specific food needs

Core written response p. 4; companion activity pp. 5.

Original written response

Explain why the cause of a specific food need changes the response.

Original sentence starter: A suitable response depends on ... because ... Before acting, I would verify ...

Authored model reasoning

An effective response links cause, consequence and control. For a diagnosed allergy, the approved individual plan and school procedure govern ingredient avoidance and preparation. A religious or ethical choice may lead to some similar ingredient decisions, but the individual's stated practice sets that boundary. A lifecycle need introduces development and practical context. Explain why "special diet" alone leaves these differences unknown. Before acting, identify the person, occasion, verified need, source of information and unresolved questions. Accept different accurate examples; reject claims that all needs require identical controls or that personal choice can be dismissed. The answer should protect privacy and include a teacher stop point when a requirement remains unclear.

Applied task: Specific-needs sorter

Coeliac disease diagnosed by a doctor belongs to Health or medical. Confirm the individual approved dietary/management advice and school requirements; students do not diagnose or design controls from the condition name alone.

Fasting during a personally observed religious period belongs to Culture or belief. Ask the person what they personally observe, when it applies and what preparation or service arrangements they want; do not assume a universal rule.

Limited cooking equipment at temporary accommodation belongs to Access or circumstance. Verify exactly which equipment, storage, water access and budget are available before proposing a feasible meal.

Choosing to avoid animal products belongs to Ethical choice on this card. Confirm the person's own ingredient and process boundaries. No card is explicitly lifecycle; do not force one into that category to use every option.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 1.2 • KEY AND CHECKING CRITERIA

Factors that shape food choices

Core reading p. 5; original written response p. 6. Companion activity pp. 7–8.

Original knowledge-check answers

1. A — Economic access

Source feedback: Cost can restrict an otherwise suitable choice.

2. C — Factors interact

Source feedback: Food decisions commonly involve several influences at once.

3. B — Cost limits the choice, so a lower-cost ingredient is needed

Source feedback: Analysis links a factor to its effect and a response.

4. A — Social and commercial

Source feedback: Promotion can shape preferences and perceived norms.

5. C — Access, time and household resources may constrain choice

Source feedback: Context can limit what is realistically available.

6. B — Substitute a lower-cost suitable ingredient after checking it

Source feedback: A trade-off must retain the non-negotiable requirement.

7. A — The available preparation window and workflow

Source feedback: Time claims should be connected to the real schedule.

8. C — Food habits and culture

Source feedback: Familiarity and shared routines shape acceptance.

9. B — Seasonal availability and transport impact

Source feedback: Environmental conditions include production and availability.

10. A — It explains the trade-off and fits the person's context

Source feedback: A defensible choice works within real constraints.

Applied task: checking criteria

Judge the four ratings against the printed fictional lunch data, not against assumptions about a real student's household. Cost, time, culture or family routine, and availability can each be low, medium or high when justified by the brief. The final response should compare both options and address skill and the verified need, which appear in the original general prompt even though they have no separate rating field. A defensible recommendation names the preferred option, evidence for that choice and a trade-off. There is no universally correct rating outside the scenario. Reject an option that violates a confirmed requirement even if it performs well on price or convenience.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 1.2 • RESPONSE AND APPLIED SOLUTIONS

Factors that shape food choices

Core written response p. 6; companion activity pp. 7–8.

Original written response

Analyse two factors that could shape one person's food choice.

Original sentence starter: The first factor is ... which could ... However, ... may ... Therefore ...

Authored model reasoning

A strong analysis uses one person or fictional brief and develops two causal links. For example, limited money may rule out a costly suitable product, while a short preparation window may rule out an elaborate method. Explain how the factors interact and propose a response that preserves the verified requirement. A lower-cost suitable ingredient or simpler preparation method may help, provided current ingredients and controls are checked. Do not award full credit for a disconnected list of factors. Look for evidence such as available time, prices, equipment or stated practice, and a clear recommendation with a remaining limitation. Accept alternative factors when the explanation is supported by the supplied context.

Applied task: Choice-factor matrix

Cost and time are strong constraints: A is \$0.80 under budget and fits the ten-minute window by two minutes; B is \$0.40 over budget and exceeds the window by five minutes. A is the more realistic response on the supplied facts.

Availability favours A because ingredients are already present, whereas B requires a shop visit. Basic assembly skills suit A; B requires cooking as well as assembly. Both proposed ingredient lists appear consistent with the ethical aim, but current packages and personal boundaries require verification.

Culture/family routine may have a medium or high influence because rice is familiar, but it is not a universal cultural rule. Accept justified low/medium/high ratings: the source asks students to rate influence, not discover a fixed numeric score.

The matrix should explicitly discuss all six general-prompt factors, even though only four are original dropdown fields. A strong recommendation identifies the trade-off, such as choosing familiar A within resources while retaining variety and Sam's preference. B could be reconsidered only if time, budget and access are changed explicitly.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 1.3 • KEY AND CHECKING CRITERIA

Meal planning for a specific circumstance

Core reading p. 7; original written response p. 8. Companion activity pp. 10–11.

Original knowledge-check answers

1. C — Person, need, occasion and constraints

Source feedback: A brief defines the problem before a recipe is selected.

2. B — Balance is judged across the pattern

Source feedback: Variety and contribution must be considered together.

3. A — Preparation must finish within 35 minutes

Source feedback: A time limit can be tested against the workflow.

4. C — At the time of purchase and use

Source feedback: Product formulations can change.

5. B — It does not yet meet the brief

Source feedback: Practical constraints are part of suitability.

6. A — The ingredients, cost and timing meet three stated criteria

Source feedback: Evidence must be compared with the original criteria.

7. C — Record it and stop for confirmation

Source feedback: Uncertainty must remain visible until resolved.

8. B — Transport, portion and service needs can change

Source feedback: Breakfast at home and lunch at school pose different constraints.

9. A — One that retains the need and improves a stated criterion

Source feedback: A design change needs a reason linked to the brief.

10. C — A proposal requiring current checks

Source feedback: Planning supports decisions but does not replace verification.

Applied task: checking criteria

Use the printed fictional brief as the authority for the person, occasion and constraints. Breakfast, lunch and dinner should each include a reason, with varied food-group contributions visible across the plan. Exact foods may vary; check that choices remain feasible within cost, time, equipment and transport requirements. The original general prompt also asks for food-group contribution, so this should be included in each reason or a supporting note. Three pre-service checks should cover current ingredients, process or storage controls, and the teacher's confirmation of unresolved requirements. A strong answer makes assumptions visible. Do not turn this classroom exercise into an individual diet prescription or require students to reveal private food circumstances.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 1.3 • RESPONSE AND APPLIED SOLUTIONS

Meal planning for a specific circumstance

Core written response p. 8; companion activity pp. 10–11.

Original written response

Justify a meal-plan decision against the person, need and constraints.

Original sentence starter: The plan is suitable for ... because ... It also responds to ... The final checks are ...

Authored model reasoning

Expect a justified decision rather than a menu list. The response should identify the user, verified need and at least one relevant constraint, then connect the selected meal or ingredient to these requirements. It should consider the food pattern across the day rather than claim that one ingredient guarantees balance. A strong answer checks preparation time, equipment and the eating occasion, including transport or storage when relevant. Finish with current label verification, confirmation of preparation controls and resolution of unanswered questions before service. Accept different suitable proposals when supported by the brief. Do not accept a medical suitability guarantee based on a recipe title or a complete-looking menu.

Applied task: Circumstance meal planner

An example proposal is oats, fruit and a checked plant drink for breakfast; a bean and vegetable wholegrain sandwich with fruit for lunch; and rice, beans and vegetables for dinner. This is an example concept, not a recipe or a verified complete diet. Other varied plans can be valid.

Food-group reasoning should identify grains, fruit, vegetables and legumes as contributing to the broad pattern. A plant drink's role depends on its actual composition; it cannot automatically be treated as nutritionally equivalent to dairy from its name alone.

The before-school meal must fit 15 minutes and the evening proposal 30; the lunch needs no school heating. The \$12 criterion cannot be verified without current prices and quantities, so students should list the data to obtain instead of declaring a made-up total.

Three useful pre-service checks are current ingredient/package evidence against Leila's stated boundary; teacher-approved chilled transport and storage; and confirmation of preparation controls/equipment and portion/practicality. Accept other precise checks linked to the brief. No student should claim the proposal guarantees medical suitability.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 2.1 • KEY AND CHECKING CRITERIA

Food taboos and cultural patterns

Core reading p. 9; original written response p. 10. Companion activity pp. 13–15.

Original knowledge-check answers

1. A — A context-dependent social rule about food
Source feedback: Taboos gain meaning within particular communities and histories.
2. C — It erases variation within the group
Source feedback: Cultural practices are not identical for every person.
3. B — Some people may observe this practice; confirm with the individual
Source feedback: Qualified language keeps the person and context visible.
4. A — Food meanings vary by context
Source feedback: Familiarity is cultural, not universal.
5. C — A current recognised community source with context
Source feedback: Authority, currency and context strengthen the claim.
6. B — A description of the practice and its context
Source feedback: Investigation describes rather than ranks cultures.
7. A — History, migration and community practice can change
Source feedback: Food practices respond to social conditions.
8. C — Does this source describe the same place, time and community?
Source feedback: Relevance depends on the context of the brief.
9. B — Name the foods and investigate who eats or avoids them and why
Source feedback: Neutral description supports respectful comparison.
10. A — Confirm the individual's actual practice
Source feedback: The brief concerns a person, not a stereotype.

Applied task: checking criteria

The three original repairs can read: “Some people in this community may avoid particular foods; practice varies and needs confirmation”; “This protein is unfamiliar to me; I need to learn its food context without judging the people who use it”; and “One website supports only the context it actually describes, so other relevant evidence may be needed.” Identify a current recognised community source or the individual for the next question, as appropriate. The source general prompt asks for six statements while its form supplies only three. Any three added print statements must be marked as authored practice; judge them by the same principles of respectful description, limited claims and relevant evidence.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 2.1 • RESPONSE AND APPLIED SOLUTIONS

Food taboos and cultural patterns

Core written response p. 10; companion activity pp. 13–15.

Original written response

Explain how to investigate a food taboo without stereotyping.

Original sentence starter: The evidence suggests ... in this context. It does not prove ... I would confirm ...

Authored model reasoning

The written task asks for respectful evidence-based explanation of a food practice. A strong response defines the practice in context, avoids presenting a whole community as identical and explains why the source is relevant to the place and time being investigated. Use qualified language and distinguish an account of some people from a universal rule. A current recognised community source can support a limited claim; the individual's actual practice still needs confirmation before food design. Reject disgust-based comparisons or a hierarchy of “normal” and “strange” foods. Accept different examples when accurately attributed and appropriately bounded. Students should not invent local cultural knowledge or assume classmates must disclose personal observance.

Applied task: Context before conclusion

Original claim 1: “Some members of this community may avoid these foods in this context; individual practice needs confirmation.” Needed evidence is an appropriately authorised community account and the person's own stated practice. Avoid replacing one universal stereotype with another.

Original claim 2: “This protein is unfamiliar to me; I can investigate its meaning, use and context respectfully.” Personal unfamiliarity is not evidence of inferiority or danger. A suitable source explains the practice in context.

Original claim 3: “This website supports a limited account; it does not establish a universal rule.” Check authorship, evidence, purpose and relevance, then corroborate as needed.

Added claim 4: Religion may influence food practice, but the individual explains their observance and boundary. Added claim 5: A dated account may describe the time/place studied; current local practice needs current evidence. Added claim 6: Public accessibility does not confer permission to reproduce local Cultural Knowledge; relevant local authority and permission must be established.

All six repairs should be qualified and evidence-seeking. Students are not required to disclose personal belief, speak for a whole group or provide restricted knowledge. The final source field can name different authorities for different claims.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 2.2 • KEY AND CHECKING CRITERIA

Religious and ethical food choices

Core reading p. 11; original written response p. 12. Companion activity pp. 17–18.

Original knowledge-check answers

1. C — Ingredients, timing, preparation or certification

Source feedback: Observance can affect both product and process.

2. B — Practice varies between individuals

Source feedback: Identity labels do not reveal every boundary.

3. A — Concern about animal welfare or labour

Source feedback: Ethical choices can respond to values about production.

4. C — Ingredients and processing still need checking

Source feedback: Broad labels may not match a person's full boundary.

5. B — Ingredient and process information

Source feedback: People need accurate information to make an informed choice.

6. A — Verify it before making the claim

Source feedback: Certification claims require evidence.

7. C — Shared equipment

Source feedback: Preparation can introduce a boundary violation.

8. B — Use the person's stated boundary

Source feedback: The individual defines their own ethical practice.

9. A — Keep it available for verification

Source feedback: Packaging supports traceable ingredient decisions.

10. C — Religious and ethical choices may both affect ingredients but arise from different authorities

Source feedback: Similar design effects can have different reasons.

Applied task: checking criteria

Look for a clear separation of ingredient facts, process questions and the question for the individual. The supplied menu can establish only the information actually printed; missing ingredient or certification information remains unknown. An answer should flag relevant shared equipment and should not assume the person's boundary from a broad identity label. Choose “Suitable on current evidence” only when the fictional brief and evidence support it, “Unsuitable” when they conflict, or “Stop to verify” when a decisive fact is missing. The decision must match the explanation. Treat packaging retention and clear communication as evidence practices, not proof that a student may approve a real food service.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 2.2 • RESPONSE AND APPLIED SOLUTIONS

Religious and ethical food choices

Core written response p. 12; companion activity pp. 17–18.

Original written response

Compare one religious and one ethical influence on food design.

Original sentence starter: Both choices may affect ... The religious boundary may ... while the ethical boundary may ...

Authored model reasoning

Compare both influences using a shared design issue. A religious practice may restrict an ingredient or require a particular preparation or certification process; an ethical choice may avoid animal-derived ingredients or respond to labour or environmental concerns. Both may affect ingredients and shared equipment, but the person's observed religious practice and ethical values provide different reasons. Explain variation within groups and the need to ask the individual rather than assume. A complete answer includes transparent ingredient and process information, current packaging and verification of unclear claims. Accept specific accurately sourced examples without requiring a universal rule. Neither religious nor ethical choice should automatically be described as an allergy.

Applied task: Ingredient and process check

Verified fictional facts include yoghurt and honey in the dessert, which conflict directly with Jo's stated avoidance of animal ingredients. The bread extract and filling names do not reveal the dressing composition or complete current product evidence.

The shared tong used for cheese and filling is a process question: explain the actual transfer/cleaning situation and ask Jo about their stated boundary. Do not equate an ethical preference with an allergy medical control, and do not infer the person's response.

The full proposed menu is Unsuitable on current evidence because of the stated yoghurt/honey. "Stop to verify" can be justified for a revised menu with those removed but unresolved dressing/packaging/process. "Suitable" is not supported for the existing proposal.

An acceptable question is "Would this revised menu and the documented equipment process meet the boundary you have described?" A transparent redesign might offer plain fruit and a verified plant-ingredient dressing, with current labels and process information retained. It remains a proposal until confirmation.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 2.3 • KEY AND CHECKING CRITERIA

Respectful investigation and evidence

Core reading p. 13; original written response p. 14. Companion activity pp. 20–22.

Original knowledge-check answers

1. B — Who produced the information and what expertise or standing do they have?

Source feedback: Authority concerns the creator's basis for speaking.

2. A — It may inform, persuade, sell or represent a community

Source feedback: Purpose can shape selection and wording of evidence.

3. C — Whether the information is current enough for the claim

Source feedback: Some food rules, labels and contacts change.

4. B — No; local authority and permission are required

Source feedback: Local knowledge cannot be invented or appropriated.

5. A — The sources support this limited claim; local practice still needs confirmation

Source feedback: A strong conclusion matches the evidence's scope.

6. C — For lived experience, while recognising it does not represent everyone

Source feedback: Different source types provide different evidence.

7. B — Source title, organisation, date, link and relevant finding

Source feedback: Traceability lets others verify the claim.

8. A — Recognising limits and seeking appropriate authority

Source feedback: Respectful inquiry makes uncertainty visible.

9. C — Its relevance to the local brief may be limited

Source feedback: Authority and relevance are separate checks.

10. B — Describe the disagreement and investigate the context

Source feedback: Conflicting evidence is a reason for careful qualification.

Applied task: checking criteria

The general task asks students to rank five descriptions; the detailed source form evaluates one description. Use all five printed fictional cards for the ranking and apply the original authority, purpose, currency, permission and use-decision fields to a selected card. Rankings may differ when students define different limited claims, so reward the reasoning rather than a universal ladder. A source with strong expertise can still lack local relevance or permission. A persuasive commercial source is not automatically false, but its purpose and evidence need scrutiny. “Cannot tell” and “Do not use yet” are valid when the card leaves a decisive question unanswered. No invented cultural conclusion is required.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 2.3 • RESPONSE AND APPLIED SOLUTIONS

Respectful investigation and evidence

Core written response p. 14; companion activity pp. 20–22.

Original written response

Evaluate whether a source is strong enough for a cultural-food design decision.

Original sentence starter: This source is/is not suitable because its authority ... Its purpose ... A remaining limitation is ...

Authored model reasoning

An effective evaluation makes a decision about a stated claim rather than rating a website in general. Check the creator's authority, purpose, currency, evidence and relevance to the place and audience. Explain what the source can establish and what it cannot. A first-person account may be valuable lived experience without representing a whole group. A government source may be strong for a regulation but not supply local cultural permission. Require explicit recognition of local Aboriginal Cultural Knowledge authority where relevant. Record a traceable citation and a next source or person for unresolved questions. Conflicting credible accounts should be investigated in context rather than concealed to create an apparently certain answer.

Applied task: Source reliability ladder

A is strongest for finding the appropriate local contact and permission pathway. It does not itself authorise copying local knowledge. C can support the particular interviewee's family account within the stated classroom permission, but must not be generalised or republished.

B is strong for the method of evaluating evidence but does not establish facts about the local practice. D is weak because it is anonymous, old, absolute and unsupported. E has a current date but a commercial purpose and no stated evidence or permission.

A defensible purpose-specific ranking is A, C, B, E, D; B may rank ahead of C if the intended claim concerns general enquiry method rather than family practice. Accept other orderings only when the claim and evidence make the reasoning explicit. Popularity or recency alone is insufficient.

For chosen A, Authority can be Strong for contact/permission guidance; purpose is community communication; currency is current and locally relevant; permission boundary is explicit; final use is Use for this limited claim. For C, Strong or Mixed is defensible within personal experience and limited consent, with no wider authority implied. Students must not fabricate permission or local knowledge.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 3.1 • KEY AND CHECKING CRITERIA

How needs change across life stages

Core reading p. 15; original written response p. 16. Companion activity pp. 24–25.

Original knowledge-check answers

1. C — Growth, body size, activity, health and ageing change

Source feedback: Lifecycle needs respond to biological and contextual change.

2. B — Infancy

Source feedback: Infancy has distinct growth and texture considerations.

3. A — Individuals also differ in health, culture, access and preference

Source feedback: Population patterns still require personal context.

4. C — An older adult with low appetite may need practical nutrient-dense smaller meals

Source feedback: Strong analysis explains why a design response fits.

5. B — Diagnosing a deficiency and prescribing supplements

Source feedback: Clinical diagnosis and treatment require professionals.

6. A — Eating skills and physical ability may differ

Source feedback: Suitability includes the ability to eat the food safely.

7. C — Needs may change with stage and individual context

Source feedback: Qualified language avoids diagnosis and stereotyping.

8. B — As a planning frame, not personal medical advice

Source feedback: Population guidance does not replace individual advice.

9. A — Activity level

Source feedback: People of the same age may have different activity demands.

10. C — It fits the eating occasion, ability, access and verified need

Source feedback: Design translates broad guidance into a workable response.

Applied task: checking criteria

For infancy, expect rapid growth and developing feeding skills linked to appropriate texture and responsible adult or professional guidance, without students inventing feeding instructions. For adolescence, accept growth and activity linked to varied feasible meals and snacks. For older age, accept a response tied to a stated factor such as appetite, access or preparation effort, not an assumption of incapacity. The final field should show how health, culture, activity, resources or preference could alter the design within the same life stage. These are broad classroom links rather than prescriptions. Reward a clear stage–reason–response chain and a visible boundary where individual information is needed.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 3.1 • RESPONSE AND APPLIED SOLUTIONS

How needs change across life stages

Core written response p. 16; companion activity pp. 24–25.

Original written response

Explain why nutrition priorities change across two lifecycle stages.

Original sentence starter: During ... the priority is ... because ... By contrast, during ...

Authored model reasoning

A strong answer compares two stages through explicit reasons and responses. Infancy involves rapid early growth and developing feeding skills; adolescence combines growth with increasing independence; older age may introduce appetite, access or preparation challenges in a particular brief. Explain how the stated change could influence texture, portion, nutrient variety or practicality. Do not accept a stereotype that all older people need identical foods or that all adolescents have the same intake requirement. The response should distinguish broad guidance from individual advice and consider at least one further factor such as activity, health, culture or access. Diagnosing a deficiency or prescribing supplements is outside the student's role.

Applied task: Lifecycle needs map

The intended broad matches are Infancy–A, Adolescence–B, Older age–C. Reasons must explain growth/development, growth plus independence, or changing health/activity/access respectively, not merely repeat the stage name.

An infant response is to follow the carer's verified feeding and texture advice from appropriate professionals, using the approved plan. Do not prescribe a food texture, weaning age or supplement from the classroom card.

An adolescent response might make a varied breakfast accessible within the school-morning window, or plan an affordable lunch that fits transport arrangements. Link the choice to growth, activity and increasing independence.

For older age, an example is reducing preparation effort with verified easy-to-prepare components while maintaining variety and the person's preferences. Do not assume all older adults need puree or reduced food. A medical need, culture, budget, equipment, activity or personal preference can change any response.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 3.2 • KEY AND CHECKING CRITERIA

Adolescent nutrition and growth

Core reading p. 17; original written response p. 18. Companion activity pp. 27–28.

Original knowledge-check answers

1. B — Growth and increasing independence

Source feedback: Adolescents are growing and making more food decisions.

2. A — Regular varied choices across the five food groups

Source feedback: Variety supports a range of nutrient needs.

3. C — Calcium

Source feedback: Calcium is one broad priority during growth.

4. B — Growth and individual physiological needs can increase its importance

Source feedback: Iron needs depend on context and should not be self-diagnosed.

5. A — Population guidance requiring individual context

Source feedback: Reference values guide groups, not individual treatment.

6. C — Food that fits transport, time, access and safe storage

Source feedback: Practical conditions determine whether a plan can be followed.

7. B — Need and safety require qualified advice

Source feedback: Students should not prescribe treatment.

8. A — Access

Source feedback: A recommendation must account for available resources.

9. C — The pattern is varied and fits the student's timetable and budget

Source feedback: Nutrition and practicality should be judged together.

10. B — Judging health from body shape

Source feedback: Food learning should not diagnose or stigmatise bodies.

Applied task: checking criteria

The four time slots should form an achievable school-day pattern with reasons, not four isolated “healthy” labels. Check that the proposed food fits the fictional timetable and any stated storage and access conditions. The final explanation should identify variety across food groups and show how preparation time, availability and activity affected at least one choice. Accept reasonable alternatives and identify a missing food-group contribution as something to consider across the wider day rather than diagnosing a deficiency from this partial pattern. Water may be included as a practical drink choice. Do not mark a plan stronger merely because it contains expensive products or supplements.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 3.2 • RESPONSE AND APPLIED SOLUTIONS

Adolescent nutrition and growth

Core written response p. 18; companion activity pp. 27–28.

Original written response

Justify a realistic school-day food pattern for an adolescent.

Original sentence starter: This pattern supports ... through ... It is realistic because ... It would need adjusting if ...

Authored model reasoning

Expect a coherent school-day pattern and reasons linked to both broad nutrition and feasibility. The answer can explain how varied food-group choices contribute energy, protein, calcium and iron without inventing an individual target. It should address time before school, breaks, transport, storage, cost and availability where the brief makes them relevant. A strong evaluation states what would change if activity or access changed. Accept different culturally appropriate food patterns when the reasoning is sound. Do not require a single ideal menu or body-based judgement. Supplements and restrictive diets are not an automatic improvement, and reference values do not authorise students to diagnose a personal need.

Applied task: School-day pattern planner

One proposal is an assembled oat/yoghurt/fruit breakfast; fruit at recess; a wholegrain vegetable and legume sandwich at lunch; and a practical after-school snack with water access. Other varied options are valid. This is not a prescribed quantity, athlete diet or complete personal nutrition assessment.

The breakfast should fit ten minutes without cooking, and lunch should need no microwave. School-approved chilled transport must be confirmed for foods that require it. Existing household foods reduce pressure on the \$6 extra-purchase budget, but an exact total needs prices and quantities.

Activity can influence the eating occasion and practical access to food/water, but does not justify diagnosing a deficiency or recommending supplements. A strong justification connects all four slots to the broad food-group pattern and the supplied access, skill, time and cost facts.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 3.3 • KEY AND CHECKING CRITERIA

Designing a lifecycle meal

Core reading p. 19; original written response p. 20. Companion activity pp. 30–31.

Original knowledge-check answers

1. A — Stage, occasion, priorities and constraints

Source feedback: The brief defines who and what the design serves.

2. C — Can be prepared in 30 minutes

Source feedback: A criterion must be specific enough to test.

3. B — Only a microwave is available

Source feedback: A constraint limits how the solution can be produced.

4. A — They affect suitability for the person and occasion

Source feedback: Design considers how the meal will actually be eaten.

5. C — Evidence about cost, time and acceptance

Source feedback: Other criteria and constraints can distinguish the ideas.

6. B — Evidence compared with each criterion

Source feedback: Evaluation is a judgement supported by observed evidence.

7. A — Revise the idea or storage plan

Source feedback: A failed constraint requires redesign.

8. C — A specific change linked to failed evidence

Source feedback: Improvement should respond to what the evaluation found.

9. B — It allows alternatives to be compared

Source feedback: Idea generation supports an evidence-based choice.

10. A — It meets the supplied classroom brief

Source feedback: The claim must remain within the evidence and brief.

Applied task: checking criteria

The original prompt requires four measurable criteria, a sketch and evaluation; the form supplies four criterion-and-evidence fields plus decision and improvement. Preserve the sketch on paper as additional evidence. Each criterion should relate to the fictional brief and have a stated test, such as time, equipment, cost, variety or packing. Check that evidence supports the verdict rather than merely repeating the criterion. If comparing ideas, use the same criteria for both. The final decision should identify a strength and a specific remaining change. A design can be selected for development while still needing verification; students should not invent actual cooking results to make the table appear complete.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 3.3 • RESPONSE AND APPLIED SOLUTIONS

Designing a lifecycle meal

Core written response p. 20; companion activity pp. 30–31.

Original written response

Evaluate a lifecycle meal idea against two measurable criteria.

Original sentence starter: The idea meets ... because the evidence shows ... It partly meets ... A useful improvement is ...

Authored model reasoning

Evaluate two measurable criteria using evidence, rather than simply praising the meal. For example, a timing estimate can show whether a thirty-minute limit is met, while an equipment list can show whether the method is feasible. Where the evidence is incomplete, mark the criterion partly met or not yet verified. A useful improvement targets the identified weakness, such as simplifying a method or revising storage arrangements. The conclusion should remain within the supplied lifecycle brief and distinguish predicted from observed outcomes. Accept other criteria that can be tested and relate to the person and occasion. “Perfect”, “healthy” or “everyone will like it” alone are not evidence.

Applied task: Lifecycle meal design

For A, four measurable criteria could be: assembled within 15 minutes; ingredients cost at most \$5; at least three identified broad food-group contributions; no school reheating required with the agreed transport arrangement. For B use 20 minutes, \$6, three contributions and the stated basic equipment/familiarity check.

An example A concept is a wholegrain bean-and-vegetable sandwich plus fruit. Identify grains, legumes, vegetables and fruit as contributions. An example B could be a familiar vegetable-and-bean rice bowl, subject to the person’s preferences and approved method. Neither is an approved recipe or proof of complete nutrition.

The sketch should label actual food components, occasion and relevant transport/equipment features. A pleasing sketch alone is not evidence of price, time or suitability. Use a timed trial/recipe plan, current price quantities, component list and equipment/transport information to test criteria.

Without price quantities or trial data, verdicts for cost and actual preparation time remain proposed or unverified. The next change should address a named weakness—for example choosing an available ingredient, simplifying assembly or seeking a current price. Do not invent a successful practical trial. No automatic puree assumption is valid for B.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 4.1 • KEY AND CHECKING CRITERIA

Allergy versus intolerance

Core reading p. 21; original written response p. 22. Companion activity pp. 33–34.

Original knowledge-check answers

1. B — The immune system

Source feedback: An allergy is an immune-system reaction.

2. A — Yes, through severe reactions such as anaphylaxis

Source feedback: Allergy controls must take severe risk seriously.

3. C — It does not involve the immune system in the same way

Source feedback: Intolerance and allergy have different mechanisms and risks.

4. B — No; use verified information and approved plans

Source feedback: Diagnosis belongs with appropriate health professionals.

5. A — The individual plan and school procedures

Source feedback: Approved plans define required controls and emergency action.

6. C — No

Source feedback: Past mild reactions do not justify ignoring a diagnosed allergy.

7. B — Follow the emergency plan, school procedures and call 000 as required

Source feedback: Classroom theory does not replace emergency procedures.

8. A — The consequences and required controls differ

Source feedback: Accurate terms support proportionate and safe action.

9. C — This plan states the verified need; it does not diagnose the person

Source feedback: Students can document requirements without giving medical advice.

10. B — Private medical detail beyond the task

Source feedback: Use the minimum personal information needed for learning.

Applied task: checking criteria

The allergy field should identify the immune system and potentially serious reactions. The intolerance field should distinguish the mechanism without dismissing symptoms or pretending students can diagnose them. The correct source selection is “Follow the verified plan and procedure”; “Diagnose from symptoms” and “Test a small amount” are unsafe student actions. The emergency field must identify suspected anaphylaxis as requiring immediate action and Triple Zero (000), with the emergency plan and school procedures followed. If supplementary sorting statements are printed, judge their classification against these distinctions and allow “both require verification” when appropriate. The source general prompt asks for sorting although its detailed form is a comparison; both evidence forms should remain visible.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 4.1 • RESPONSE AND APPLIED SOLUTIONS

Allergy versus intolerance

Core written response p. 22; companion activity pp. 33–34.

Original written response

Explain why allergy and intolerance require different risk communication.

Original sentence starter: An allergy involves ... and can ... An intolerance ... Therefore the designer must ...

Authored model reasoning

Explain the mechanism and consequence before the design implication. Allergy involves an immune response and may cause anaphylaxis; intolerance differs and still requires respect for the person's diagnosis and advice. These differences mean the same casual substitution or risk language cannot be used for both. A strong answer uses verified information, the individual plan and school procedures, avoids student diagnosis or test tasting, and protects private information. A previous mild reaction does not establish future safety. Include the emergency boundary: suspected anaphylaxis requires immediate action, Triple Zero (000) and the relevant emergency plan and procedures. Do not delay that response for a routine teacher approval.

Applied task: Allergy or intolerance?

A belongs to Allergy; B to Intolerance; C to Both require verification; D and E are Unsafe assumptions. F describes the urgent allergy emergency pathway. Accept a second annotation that emergency action depends on the situation and approved plan; it is not a routine diagnostic decision.

A food allergy is immune-mediated and can cause severe, life-threatening anaphylaxis. Intolerance acts differently and can be unpleasant; neither condition should be diagnosed by a student. Both require respect for verified advice.

Lactose-free milk can retain milk proteins, so the E claim is unsafe for milk-protein allergy. A small taste is not an acceptable classroom test. The original Student action is Follow the verified plan and procedure.

The emergency boundary should state immediate use of the person's emergency plan and school emergency procedures and calling Triple Zero (000) for suspected severe allergic reaction. Do not delay urgent help for routine teacher approval, a website search, a taste test or completion of this worksheet. Classroom text does not replace first-aid training.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 4.2 • KEY AND CHECKING CRITERIA

Labels, allergen risk and cross-contact

Core reading p. 23; original written response p. 24. Companion activity pp. 36–37.

Original knowledge-check answers

1. A — Ingredients and warnings can change
Source feedback: Current packaging is the evidence for the current product.
2. C — Ingredient list and required warning statements
Source feedback: Safe checking uses the full current label.
3. B — Unintended transfer of an allergen
Source feedback: Allergen residue can move through hands, tools and surfaces.
4. A — Use the approved clean workflow and separate equipment where required
Source feedback: Equipment controls must follow the individual plan and school procedure.
5. C — No; apply the verified plan and school rule
Source feedback: Precautionary statements require a defined decision rule.
6. B — Suitability depends on current ingredients and process
Source feedback: Names such as 'gluten free' must still be verified.
7. A — Stop and seek confirmation
Source feedback: No verified label means the decision boundary is unresolved.
8. C — Knife to board to ready-to-eat food
Source feedback: Cross-contact follows physical handling pathways.
9. B — Product, date checked, relevant statement and decision
Source feedback: Traceable decisions can be reviewed before service.
10. A — No; it can document controls and remaining uncertainty
Source feedback: Honest safety communication avoids absolute guarantees.

Applied task: checking criteria

Use the exact fictional mock label and workflow printed with the task. The response should quote or accurately identify the decisive label evidence, name a plausible transfer pathway and state a control or stop point. An allergen that conflicts with the supplied need supports rejection; missing information or an unresolved process supports stopping for teacher confirmation. “Proceed under approved plan” requires the scenario itself to establish the relevant approval and controls, not a student assumption. The product name and date support traceability but do not guarantee suitability. Accept different correctly traced pathways if they are present in the workflow. The mock package cannot approve a real ingredient or a real person’s meal.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 4.2 • RESPONSE AND APPLIED SOLUTIONS

Labels, allergen risk and cross-contact

Core written response p. 24; companion activity pp. 36–37.

Original written response

Explain a safe label-and-workflow check for a supplied diagnosed need.

Original sentence starter: First I would verify ... on the current package. I would then control ... If uncertain, I would ...

Authored model reasoning

The response should combine current product evidence with a process check. Identify the verified need, inspect the full package and record the relevant ingredient or warning statement and date. Apply the individual plan and school rule to precautionary wording rather than deciding that “may contain” is automatically suitable. Trace a realistic transfer pathway through hands, utensils, surfaces, storage or service and match it with the approved control. Keep the packaging available and the food correctly identified. If the label is missing, a control cannot be met or the requirement is unclear, stop and seek teacher confirmation. Do not accept a recipe title, appearance or previous purchase as sufficient evidence.

Applied task: Allergen label and workflow audit

Record the fictional product as Cocoa drink mix A and date as 28 September 20XX, explicitly a scenario placeholder rather than a real purchase check. Exact adverse evidence is “MILK protein” in ingredients and “Contains milk.” The front “Lactose-free” statement does not remove milk protein.

For the stated milk-protein avoidance, Reject product is the strongest decision on the extract. Stop for teacher confirmation is also necessary for missing plan/process evidence, but must not imply the visibly milk-containing product will become appropriate merely by confirming a label.

A plausible pathway is milk dessert → shared spoon → mixing bowl or food. The spoon beside the bowl creates a potential route, not proof that transfer has already occurred. Removing crumbs or the spoon would not establish suitability.

Stop before opening/using the product, refer to the teacher and current approved plan, retain complete packaging and identify products. The unlabelled jar and discarded packet remove traceability. A control plan needs approved separation/cleaning/workflow and a suitable replacement verified under school procedure; this worksheet cannot approve one.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 4.3 • KEY AND CHECKING CRITERIA

Planning food for a person with a diagnosed need

Core reading p. 25; original written response p. 26. Companion activity pp. 39–40.

Original knowledge-check answers

1. C — Verified need, ingredients, workflow, controls and stop points

Source feedback: Safe planning connects evidence to each production decision.

2. B — To reduce transfer and manage time and equipment

Source feedback: Sequence is a risk control as well as a time plan.

3. A — Teacher verifies the current label before the ingredient is opened

Source feedback: Checks need to occur before an irreversible step.

4. C — Change the recipe or do not proceed

Source feedback: The verified plan is a non-negotiable constraint.

5. B — Assumptions can be resolved before production

Source feedback: Visible uncertainty prevents guesses becoming controls.

6. A — Whether each control was followed and recorded

Source feedback: Evaluation should use evidence relevant to the brief.

7. C — According to school procedure with labels retained as required

Source feedback: Post-production handling remains part of traceability.

8. B — Follow the approved plan and stop when unsure

Source feedback: Students work within teacher-approved controls.

9. A — Stop, tell the teacher and do not claim suitability

Source feedback: A failed control changes the evidence for the product.

10. C — It reduces identified risks within approved procedures

Source feedback: Risk reduction is not a medical guarantee.

Applied task: checking criteria

The sequence should begin with the verified requirement and current label checks before opening ingredients. Next establish the approved workspace and equipment controls, then explain preparation order that reduces transfer and mix-ups. Service should preserve identification and traceable ingredient information. The final field must state an actionable stop condition, such as a missing label, conflicting requirement or failed control, followed by stopping and telling the teacher. Accept different sensible work orders when they fit the supplied fictional scenario and school-controlled boundary. Do not infer authorisation to cook from completion of this paper task. If students discuss leftovers or opened packs, their handling must remain within the teacher's current procedure.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 4.3 • RESPONSE AND APPLIED SOLUTIONS

Planning food for a person with a diagnosed need

Core written response p. 26; companion activity pp. 39–40.

Original written response

Justify a safer production plan without claiming zero risk.

Original sentence starter: The plan reduces risk by ... The stop point is ... It cannot guarantee suitability because ...

Authored model reasoning

Justify the plan by linking each main control to an identified risk. Begin with the verified need and approved information, then explain the purchasing-to-service pathway, work order, equipment controls and identification at service. State a specific stop point before ingredients are used and describe what happens if the label, requirement or control cannot be confirmed. The answer should explain that a suitable ingredient alone does not ensure a suitable process. Evaluate whether controls were actually followed rather than claiming success from an appealing dish. A defensible conclusion describes risk reduction within approved procedures and acknowledges remaining uncertainty. Reject a zero-risk guarantee or an instruction to improvise after a control fails.

Applied task: Safer preparation pathway

Step 1 should verify the individual requirements with the teacher, current full labels and recipe before ingredients are opened; check substituted brands again; retain identifying packaging and confirm storage arrangements. A brand remembered from last year is not adequate evidence.

Step 2 should identify school-approved workspace cleaning, equipment separation and storage controls. These are questions for current procedure, not student-made claims that a wipe or a glove guarantees safety.

Step 3 should order preparation/cooking to avoid mix-ups and transfer, keep verified ingredients identifiable, and pause when shared equipment or a control is uncertain. A method and its suitability require approval before practical work.

Step 4 should identify the correct food/person and service equipment; retain packaging/records as required; manage leftovers and opened packs according to school procedure. Clean-up remains part of the route. The plan must include purchasing-to-clean-up coverage even though the response form has four sequence boxes.

A clear failure response is stop, notify the teacher, isolate the affected proposal/food as directed and make no suitability claim. Unknown labels, substitutions, missing approval, mixed utensils or failed controls are stop triggers. For an actual suspected severe allergic reaction, follow emergency procedures immediately; ordinary planning approval is not a reason to delay help.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 5.1 • KEY AND CHECKING CRITERIA

Nutritionally modified and fortified foods

Core reading p. 27; original written response p. 28. Companion activity pp. 42–43.

Original knowledge-check answers

1. A — Adding nutrients to food for a defined purpose
Source feedback: Fortification changes nutrient composition.
2. C — It commonly restores nutrients lost during processing
Source feedback: The reason for adding nutrients matters.
3. B — To address a recognised public-health need
Source feedback: Some fortification is designed for broad population benefit.
4. A — The nutrition information and Australian labelling rules
Source feedback: Claims need evidence and regulatory context.
5. C — No
Source feedback: One added nutrient does not settle all ingredients or needs.
6. B — A food formulated with added iron
Source feedback: Changing nutrient composition is a nutritional modification.
7. A — It links the product change to the need
Source feedback: A design justification needs cause and intended benefit.
8. C — The product may support intake but does not replace individual advice
Source feedback: Food claims should not become treatment claims.
9. B — FSANZ information and the current label
Source feedback: Australian regulatory claims require relevant authority.
10. A — Need, nutrient evidence, ingredients, cost and practicality
Source feedback: Suitability is a multi-criterion judgement.

Applied task: checking criteria

The general source prompt mentions three mock packages while the detailed form compares Product A and Product B. Consider the third printed package in the broader judgement and preserve the A/B fields. For each product, identify the modification and the evidence actually present, using a consistent basis where numbers are compared. Select A, B or neither only after considering the supplied need, ingredients, cost and practical context. Missing nutrient information is not zero and must not be invented. A complete justification includes a benefit and a limitation. Accept different choices supported by the brief, but reject a claim that added nutrients alone establish medical suitability or overall quality.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 5.1 • RESPONSE AND APPLIED SOLUTIONS

Nutritionally modified and fortified foods

Core written response p. 28; companion activity pp. 42–43.

Original written response

Explain how one nutritionally modified food responds to a specific need.

Original sentence starter: The product is ... It has been modified by ... This may support ... but the label still needs ...

Authored model reasoning

Identify the product and its actual modification, then connect that change to a specific stated need. A response might discuss reduced sodium or an added vitamin or mineral, provided the printed label evidence supports it. Explain the purpose rather than assuming that any modification improves suitability. The answer should check nutrient information, ingredients, serving size, cost and practicality and acknowledge an important limitation. Fortification is not a diagnosis or a replacement for individual professional advice. Distinguish a nutrient property from a general conclusion about health, and use FSANZ as the appropriate source for Australian claim rules. Accept a conclusion that the product is unsuitable when the evidence conflicts with the brief.

Applied task: Claim versus evidence

A is modified by calcium addition. Its extract reports 120 mg calcium per 100 mL, meeting the invented minimum of 100; \$0.22 per 100 mL meets the \$0.25 ceiling. No animal ingredient is named in the fictional extract, but the full current product label, ingredient origins, manufacturing information and Ari's own boundary still require checking.

B is modified by added protein: 8.0 g per 100 mL. The brief asks for calcium and cost, not maximising protein; 30 mg calcium is below the invented minimum and \$0.32 exceeds the ceiling. A front statement about protein therefore does not answer this brief.

C also lists calcium addition and 120 mg per 100 mL, but \$0.35 exceeds the stated cost ceiling. It may become an alternative if the cost criterion is deliberately renegotiated; a student cannot silently ignore the criterion.

The original A/B choice is Product A on the fictional comparative evidence. For the overall comparison A is the only option that meets both numerical criteria. It remains a proposal requiring current verification. Neither on current evidence is defensible only if the student distinguishes approval of a real product from this fictional comparison and names the missing evidence.

If students calculate the 250 mL serve cost, A is \$0.55; B is \$0.80; C is \$0.875 (about \$0.88). Calcium per 250 mL is A 300 mg, B 75 mg, C 300 mg. Calculations are optional supporting evidence and must not be presented as a personal intake prescription.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 5.2 • KEY AND CHECKING CRITERIA

Dietary fibre and adolescent needs

Core reading p. 29; original written response p. 30. Companion activity pp. 45–46.

Original knowledge-check answers

1. C — Plant foods such as grains, legumes, fruit and vegetables
Source feedback: Fibre is supplied by a variety of plant foods.
2. B — Forms a gel and can slow digestion
Source feedback: Soluble fibre has distinct digestive effects.
3. A — Bowel regularity by adding bulk
Source feedback: Insoluble fibre contributes to digestive health.
4. C — Large sudden changes may be uncomfortable
Source feedback: Gradual changes and adequate fluid support tolerance.
5. B — Wholegrain bread instead of lower-fibre white bread
Source feedback: Wholegrain choices commonly provide more fibre.
6. A — Fluid supports the way fibre moves through the digestive system
Source feedback: Fibre advice should include adequate fluids.
7. C — As population guidance, not a diagnosis
Source feedback: Reference values require context.
8. B — Oats, fruit, wholegrain bread, vegetables and legumes
Source feedback: Different foods provide fibre within a balanced pattern.
9. A — A specific affordable swap that fits the person's routine
Source feedback: Practical advice can be sustained.
10. C — When symptoms, diagnosed conditions or treatment are involved
Source feedback: Classroom learning does not replace personal care.

Applied task: checking criteria

Assess the breakfast, lunch and snack-or-dinner swaps against the printed fictional starting pattern. Each should identify a realistic change and a fibre-containing food, with variety across the proposed day. The water and gradual-change field should show a practical routine without prescribing a treatment schedule or arbitrary fluid target. The final explanation needs to connect feasibility with the adolescent's stated context. A strong plan can retain familiar foods while making manageable changes; it need not replace everything. Do not calculate a total from missing portion or product data. Where a diagnosed condition or symptoms are introduced, the correct boundary is individual professional advice rather than a more forceful general recommendation.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 5.2 • RESPONSE AND APPLIED SOLUTIONS

Dietary fibre and adolescent needs

Core written response p. 30; companion activity pp. 45–46.

Original written response

Design and justify a practical way to increase fibre for an adolescent.

Original sentence starter: I would add/swap ... because it provides ... This is practical because ... Water and gradual change matter because ...

Authored model reasoning

An effective response proposes specific achievable swaps and explains their contribution to a varied pattern. Wholegrains, legumes, fruit and vegetables can provide fibre through different meals and snacks. The answer should connect its choices with cost, access, preference and routine rather than rely on a product slogan. Explain that fluids support fibre's function and that gradual change can reduce discomfort. Treat the adolescent adequate-intake table as population guidance, not a personal prescription or diagnosis. If students use numerical fibre totals, require reliable quantities and product data. Accept suitable alternatives to the model foods. Do not accept claims that a classroom plan treats symptoms or replaces professional advice for a diagnosed condition.

Applied task: Fibre pattern planner

Plant foods already present include bread, crackers, rice and vegetables; their exact fibre content depends on product and quantity. Avoid claiming the day contains zero fibre. No quantities or nutrition data are supplied, so an exact total or diagnosis is not supported.

An achievable breakfast swap is wholegrain toast or oats with fruit, chosen to fit ten minutes and the person's preferences. A lunch swap is wholegrain bread with an acceptable vegetable/legume addition. A snack could include fruit; dinner could vary vegetables and legumes or select an appropriate wholegrain staple.

The reasoning should use several source categories—wholegrains, legumes, vegetables and fruit are useful examples—while considering affordability, availability and familiarity. Nuts/seeds can be valid examples only subject to the person's requirements and school controls; they are not compulsory.

Water remains accessible across the day and changes can be introduced gradually in practical steps. Do not prescribe a fixed water dose or supplement. Explain why the change is feasible and when individual health advice is needed. Increasing a number alone is not a complete eating plan.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

SECTION 5.3 • KEY AND CHECKING CRITERIA

Support networks and evaluating reliable help

Core reading p. 31; original written response p. 32. Companion activity pp. 48–49.

Original knowledge-check answers

1. B — People, groups and services that provide appropriate help
Source feedback: Support can come from informal and formal sources.
2. A — The individual emergency plan, trained staff and emergency services
Source feedback: Urgent risk needs approved emergency pathways.
3. C — Education, resources and referral information
Source feedback: Organisations support learning but do not replace individual care.
4. B — Useful support must be reachable in practice
Source feedback: Phone, web, referral, cost and location affect access.
5. A — Authority, currency, purpose and evidence
Source feedback: Popular does not automatically mean reliable.
6. C — It may not provide qualified individual medical advice
Source feedback: Different supports have different roles.
7. B — The person's need matches the service's role
Source feedback: Support should fit the actual problem.
8. A — One service may not meet every information, practical and emergency need
Source feedback: Networks combine complementary roles.
9. C — Explain what help is provided, access barriers and evidence of usefulness
Source feedback: Evaluation judges effectiveness against the need.
10. B — Use this service for its stated role and escalate urgent or clinical matters appropriately
Source feedback: A recommendation must state both value and boundary.

Applied task: checking criteria

For the fictional school-excursion milk-allergy scenario, informal support can include family or trusted adults helping communicate verified information and practical needs. School staff manage the school-controlled arrangements. Allergy & Anaphylaxis Australia or ASCIA can supply general educational resources through their verified websites, but cannot approve the individual menu through a general page. Clinical questions belong with the treating team; urgent suspected anaphylaxis requires immediate action and Triple Zero (000) under the relevant emergency procedures. The service-access field should use the printed verified route. Evaluate at least one benefit and limitation, including an access barrier if the scenario supplies one. Do not request real private medical details or invent a new individual management plan.

These criteria guide the detailed fictional-data solutions on the following page. They do not grant practical approval.

SECTION 5.3 • RESPONSE AND APPLIED SOLUTIONS

Support networks and evaluating reliable help

Core written response p. 32; companion activity pp. 48–49.

Original written response

Evaluate a support network for a person with a specific food need.

Original sentence starter: This network can provide ... It can be accessed by ... Its limit is ... For urgent help ...

Authored model reasoning

An evaluation should identify the person's information, practical and clinical needs and match each to an appropriate support. Explain what a recognised organisation can provide, how its resources can be accessed and where its scope ends. Family or peers may help with routines and lived experience, while qualified professionals handle individual diagnosis and treatment. School staff control school procedures. Consider access barriers and coordination rather than just listing organisations. For suspected anaphylaxis, identify immediate emergency action and Triple Zero (000), with the emergency plan and school procedures followed. A strong conclusion states why the network is useful, what remains unresolved and where referral is required; it does not claim one source can do everything.

Applied task: Support network map

Informal support may be family helping communicate the student's existing plan and preferences, and friends supporting inclusion without promising safety or acting as clinicians. School staff coordinate excursion controls, supervision, verified information and the school's emergency arrangements.

A recognised organisation such as Allergy & Anaphylaxis Australia offers general education and resources on risk management/outside-home contexts through the supplied official website. ASCIA offers patient/carer information and relevant plan resources; Healthdirect offers general information. None of these pages approves a specific food or replaces the treating team.

The qualified pathway is the person's treating team for individual clinical advice and the teacher/school for local practical controls. For suspected severe allergic reaction use the individual emergency plan and school emergency procedures and call Triple Zero (000); do not wait for a forum, routine appointment or webpage search.

Access evidence should state the organisation and supplied web address, and consider internet availability, readability, language/access needs and whether school/family help is needed. Do not invent phone hours or claim that every service provides appointments.

An effective network links each need to the correct role and keeps limitations clear. A blog may offer a recipe idea but cannot guarantee allergy suitability. Before the excursion, the menu, full current labels and school-approved controls remain to confirm; the student should not provide unnecessary private medical history in this workbook.

Use the stated evidence and boundaries when accepting alternatives. This is formative guidance, not a formal marking scheme or practical sign-off.

MODEL RESPONSES • AUTHOR-CREATED PRACTICE

Core learning tools: 33–36

Core p. 33 • From a need to a decision

Accept an explicit assumption such as every student has an insulated bag, every venue has refrigeration, or Sam accepts the proposed ingredients. Replace it with a focused storage, equipment or preference question; the teacher can confirm excursion arrangements and the fictional brief establishes the user context. A cold meal is not automatically safe without verified storage controls.

Core p. 34 • Ask respectfully; record precisely

A possible revision is “Are there any ingredients or preparation practices you would like us to consider for this occasion?” Accept wording that avoids assigning a belief, leaves the person free to answer and asks only for relevant design information. The student should distinguish general cultural research from the individual’s actual requirements.

Core p. 35 • Development changes the question

The rounds retain discrete pieces; coarse mash contains smaller uneven pieces; puree looks more uniform. These visual observations do not establish a safe clinical texture or age suitability. A person’s development, actual needs and any professional instructions govern the decision. Do not infer swallowing safety or prescribe a sample from the image.

Core p. 36 • Follow the evidence chain

“Plant-based” is a broad product description. It does not itself establish the ingredients, allergen declarations, cross-contact conditions or suitability under an individual plan. Check the current product against the verified need and follow approved school controls. Do not taste-test suitability. Anaphylaxis requires immediate emergency action, not a routine planning wait.

MODEL RESPONSES • AUTHOR-CREATED PRACTICE

Core learning tools: 37–40

Core p. 37 • Spot the cross-contact route

Observations include peanuts in an open bowl, fragments on the shared board and fragments on the apple plate rim. The scene suggests transfer from the peanut handling area to a serving surface/food; it does not prove every prior handling event. Stop preparation/service and refer to the teacher and approved plan for appropriate controls. Picking visible pieces off does not establish that the food is safe.

Core p. 38 • Compare a common amount

For 150 mL of fictional Drink B: cost = $\$2.10 \times 150 \div 750 = \0.42 ; calcium = $100 \text{ mg} \times 150 \div 100 = 150 \text{ mg}$. State both units. These calculations describe only the invented cost and calcium comparison; they cannot establish allergen suitability, other nutrient needs, acceptability or overall diet quality. The 150 mL amount is calculation practice, not a recommended serving.

Core p. 39 • Confirm the recipe before making

This is a verification register, not a cooking instruction page. Expect a named current recipe and a traceable teacher-confirmed version before production. The teacher guide documents Banoffee quantity and honey/rice-malt contradictions, pineapple cake flour/baking-powder method omission, pancake dry-ingredient omission and chicken doneness wording issue. No original recipe has been silently corrected or approved. Paper planning may proceed, but actual making evidence requires authorised practical work.

Core p. 40 • Choose a source for its role

The absolute words “every” and “fixes” overgeneralise; the claim gives no assessment, cause, dose, relevant evidence or limitations, and may have a commercial purpose. Suitable help includes a trusted adult and an appropriate qualified health professional; recognised organisations may supply general education. A social-media testimonial alone is insufficient. Do not award a diagnosis or supplement recommendation.

MODEL RESPONSES • AUTHOR-CREATED PRACTICE

Core learning tools: 41–42

Core p. 41 • Bring the ideas together

1. B — A diagnosed peanut allergy with an individual plan

Source feedback: A diagnosed need changes selection and preparation controls.

2. A — A context-dependent social rule about food

Source feedback: Taboos gain meaning within particular communities and histories.

3. C — Growth, body size, activity, health and ageing change

Source feedback: Lifecycle needs respond to biological and contextual change.

4. B — The immune system

Source feedback: An allergy is an immune-system reaction.

5. A — Adding nutrients to food for a defined purpose

Source feedback: Fortification changes nutrient composition.

Core p. 42 • Language for evidence-based design

Reference page; no new marked task. Definitions support the specific course usage and do not diagnose or authorise practical work. Exact sources appear in the teacher guide. Distinguish simulated/observed/predicted evidence throughout.

The retrieval questions reuse the first original check from section 1 in each module. They are not five additional unique source questions. Core p. 42 is a language/reference page, not a new marked task.

EVIDENCE QUALITY • CORE PAGES 43–44

Folio stages 1–2

Stage 1 • The need and design brief

Core workbook p. 43. Original response ID: folio-1.

Original action: Define the problem, intended user and required result without recording unnecessary private medical details.

Original evidence: A clear brief showing the person, occasion, verified need, constraints and items marked Teacher to confirm.

Original thinking question: What must this food response achieve, and what information is authoritative?

Original sentence starter: The design brief asks me to ... for ... The verified requirement is ...

Authored checking criteria: Expect a concise design brief with the fictional or authorised user, occasion, verified need and required result. Separate confirmed constraints from assumptions and Teacher to confirm items. Name the authority for the requirement without copying private medical history. The brief should be specific enough to generate criteria, but must not invent an approved clinical plan or a formal assessment notice.

Stage 2 • Success criteria

Core workbook p. 44. Original response ID: folio-2.

Original action: Turn the brief into a small set of observable tests.

Original evidence: Four to six criteria covering the verified need, nutrition, practicality, cost, safety and respectful practice.

Original thinking question: How will you know whether the finished response meets the brief?

Original sentence starter: The result will be successful if ... This can be checked by ...

Authored checking criteria: Look for four to six observable criteria that cover the brief: verified need, broad nutrition, practicality, cost, safety and respectful practice as relevant. Each criterion needs a way to test it. A time limit, equipment requirement or traceable ingredient check is more useful than “healthy” or “perfect”. Safety criteria remain subject to current teacher-approved procedures.

EVIDENCE QUALITY • CORE PAGES 45–46

Folio stages 3–4

Stage 3 • Research and ideas

Core workbook p. 45. Original response ID: folio-3.

Original action: Use reliable evidence and generate at least two genuinely different responses.

Original evidence: Source notes plus two labelled ideas with strengths, limits and questions.

Original thinking question: What evidence changes your design decision?

Original sentence starter: Source ... supports ... One possible response is ... Another is ...

Authored checking criteria: Expect traceable source notes and at least two genuinely different ideas.

The source record should identify its author or organisation, title, date, link and limited finding.

Compare strengths, limits and unresolved questions for each idea. Do not credit duplicated ideas presented as alternatives. Local cultural knowledge requires appropriate authority and permission, and general health pages cannot replace individual professional advice.

Stage 4 • Chosen idea and plan

Core workbook p. 46. Original response ID: folio-4.

Original action: Select one direction and make it practical.

Original evidence: A justified choice plus ingredients, equipment, sequence, timing and cost notes.

Original thinking question: Why is this the strongest option against your criteria and constraints?

Original sentence starter: I selected ... because it meets ... The main trade-off is ...

Authored checking criteria: The chosen idea should be justified against the criteria and compared with the alternative. Ingredients, equipment, sequence, timing and cost notes should make the proposal feasible while keeping unknowns visible. A recipe from the source library is not automatically a corrected or approved master. The teacher must confirm a current usable recipe and practical conditions before the proposal is used in production.

EVIDENCE QUALITY • CORE PAGES 47–48

Folio stages 5–6

Stage 5 • Safer production readiness

Core workbook p. 47. Original response ID: folio-5.

Original action: Identify the controls and teacher-owned stop points before practical work.

Original evidence: Current label checks, hygiene and cross-contact controls, plus explicit questions for the teacher.

Original thinking question: What must be verified before any ingredient is opened?

Original sentence starter: Before production I will verify ... I will stop and ask the teacher if ...

Authored checking criteria: Expect current label evidence, identified transfer risks, approved hygiene and workflow controls, and clear teacher questions or stop points. The student should distinguish a product claim from actual suitability and avoid guaranteeing zero risk. This stage records readiness thinking; it is not an allergy clearance, first-aid qualification or authorisation to improvise around an unclear label or control.

Stage 6 • Making evidence

Core workbook p. 48. Original response ID: folio-6.

Original action: Record one authorised checkpoint that proves a decision, process, problem or change.

Original evidence: A dated observation or teacher-authorised photo with a meaningful caption; not a competence claim.

Original thinking question: What happened, what did you change, and what does the evidence prove?

Original sentence starter: During production ... I changed ... because ... This evidence shows ...

Authored checking criteria: Require a dated observation or teacher-authorised image from an actual authorised practical checkpoint, with a caption explaining the decision, problem or change. Evidence should describe what happened and what it demonstrates. A staged stock photograph cannot prove student performance. If only a paper simulation occurred, label it as simulation and leave actual making evidence for an authorised practical rather than inventing it.

EVIDENCE QUALITY • CORE PAGES 49–50

Folio stages 7–8

Stage 7 • Testing against criteria

Core workbook p. 49. Original response ID: folio-7.

Original action: Test the food response using the criteria written in Stage 2.

Original evidence: Results for each criterion, supported by observations or a teacher-authorised final photo.

Original thinking question: Which criteria were met, partly met or not met, and what is your evidence?

Original sentence starter: Criterion ... was met/partly met/not met because ...

Authored checking criteria: Compare actual evidence with each Stage 2 criterion and record met, partly met or not met with reasons. Use observations, measurements or authorised photographs where appropriate. Predicted outcomes must stay distinguishable from tested results. A food that looks appealing can still fail a time, cost, ingredient or process criterion. Note incomplete evidence honestly and identify the next test or correction.

Stage 8 • Evaluation and improvement

Core workbook p. 50. Original response ID: folio-8.

Original action: Make a justified final judgement and name one realistic next change.

Original evidence: A conclusion tied to the brief, criteria, evidence and limitations.

Original thinking question: How well did the result solve the problem, and what would you change next time?

Original sentence starter: Overall, the response ... The strongest evidence is ... Next time I would ... because ...

Authored checking criteria: The final judgement should return to the brief and criteria, identify the strongest evidence and acknowledge limitations. Recommend one realistic improvement connected to an observed weakness or unresolved issue. Do not treat a completed page as proof of competence or claim individual medical suitability. If practical work was not authorised or completed, state the evaluation applies only to the paper proposal.

SOURCE DOCUMENT AUDIT • NOT COOKING INSTRUCTIONS

Recipe verification: 1–3

The accessible site reproductions contain unresolved instructions. Attach a teacher-confirmed current recipe master before practical use; these notes do not silently correct or approve the recipes.

All nine originals are preserved unchanged in the hashed source snapshot. Recipe titles are reproduced for identification. Their dietary or nutrient claims have not been established by current product evidence or nutrient analysis.

Banoffee Chia Pudding

The chia ingredient list says “½ cup (250ml)” coconut milk, but the method uses 250ml. Caramel lists 30ml while its method uses 60ml. The topping ingredient is honey but the method names rice malt syrup. Maple syrup is listed for the chia but the combining method does not mention it. Obtain the original master and confirm quantities, ingredient use and method before preparation.

Dairy Free Chocolate Coconut Custard

The ingredient list includes a pinch of sea salt but the method does not identify when to add it. Confirm the full current method, egg-custard cooking and chilling controls, and all product labels with the approved master. The source title “Dairy Free” does not establish suitability for a particular milk-allergy plan or prove absence of cross-contact.

Gluten Free Pineapple Upside Down Cake

Flour and baking powder are listed but no method step adds them. The topping ingredient calls for melted butter while the method creams softened butter. Confirm the intended process, quantities and yield from the master. The “Gluten Free” title cannot replace current checks of flour, baking powder, other products and process requirements.

Some source reproductions also contain old syllabus codes and formatting debris. These are historical source features, not current student cooking instructions.

SOURCE DOCUMENT AUDIT • NOT COOKING INSTRUCTIONS

Recipe verification: 4–6

High Fibre Banoffee Chia Pudding

This is a different source formulation from Banoffee Chia Pudding, with different chia, coconut-milk and date quantities. Do not transfer a guessed correction between them. Its ingredients allow rice malt syrup or honey while the method names rice malt syrup; confirm the selected option and current master. No nutrient analysis is supplied to substantiate the title's high-fibre claim.

High Protein Flank Steak Quinoa

The source gives one minute per side for the steak. That timing alone does not establish an appropriate outcome for every thickness, appliance or person. Teacher-confirm the cut, current method and controls. Confirm yield and current ingredients as well. "High Protein" is the source title; no quantified nutrient analysis is supplied here.

Keto Ricotta Pancakes

The ingredient list includes lemon zest, sugar, coconut flour and baking soda, but the combining method adds only eggs, ricotta, milk and vanilla. The complete method requires confirmation against the master. "Keto" is a source title, not an endorsement of a restrictive adolescent diet or verified nutrition analysis.

Keep the person and the claim distinct

A food can be described by a dietary pattern, a nutrient modification or an allergy-related title, but these descriptions answer different questions. The actual brief, current ingredients and approved process determine what must be checked. A recipe name cannot establish an individual diagnosis, required nutrient target or safety control.

Unresolved quantities or missing method steps are a reason to obtain the master and pause practical use. Students can still audit the source and complete paper planning without guessing the intended instruction.

SOURCE DOCUMENT AUDIT • NOT COOKING INSTRUCTIONS

Recipe verification: 7–9

Paleo Peri-Peri Chicken Sweet Potato Fries

The source offers clear juices OR an internal temperature of 75°C as the cooking check. Do not use colour or clear juices as a substitute for thermometer evidence. FSANZ recommends at least 75°C in the centre of poultry, checked with a clean food thermometer. Teacher-confirm the current complete method, knife supervision and controls; the source title is not a suitability guarantee.

Peri-Peri Chicken Sweet Potato Fries

The same clear-juices OR temperature problem occurs here. Use the teacher-approved thermometer control consistent with current guidance. This source version has different chilli quantities from the “Paleo” version, so do not merge the two recipes or silently choose a quantity. Confirm the original master, complete method, labels and practical controls.

Vegan Carrot Cupcakes

Verify the chosen margarine or substitute and every current ingredient against the person’s actual boundary. The source allows “nuttelex margarine or similar”; a substitute is not automatically equivalent in ingredients or performance. Confirm the complete method, yield and icing process with the master. The title does not establish allergen suitability or approve the school workflow.

Temperature-source note: FSANZ’s Food safety basics recommends at least 75°C in the centre of poultry. The current NSW consumer table lists 74°C; this guide retains the source recipe’s 75°C as consistent with FSANZ. Both support thermometer evidence. Do not turn the source recipe’s clear-juices alternative into an independent approval rule.

COMPLETE LOCALLY BEFORE AUTHORISED PRACTICAL WORK

Recipe master and approval record

Attach the complete teacher-confirmed current master for each selected recipe. Record its source/version, checked date and the specific corrections or clarifications resolved. Keeping this record does not replace the school's existing approval procedure.

Source recipe title	Attached master / version / checked date
Banoffee Chia Pudding	_____ _____
Dairy Free Chocolate Coconut Custard	_____ _____
Gluten Free Pineapple Upside Down Cake	_____ _____
High Fibre Banoffee Chia Pudding	_____ _____
High Protein Flank Steak Quinoa	_____ _____
Keto Ricotta Pancakes	_____ _____
Paleo Peri-Peri Chicken Sweet Potato Fries	_____ _____
Peri-Peri Chicken Sweet Potato Fries	_____ _____
Vegan Carrot Cupcakes	_____ _____

Record alongside the selected master

Confirm the brief and current ingredient labels; applicable individual plans and school allergy/emergency controls; quantities, yield and complete method; equipment, supervision and workflow; storage, service and traceability. Mark any unresolved point and pause the affected practical.

Teacher / local record reference: _____

Date and approved practical scope: _____

Paper simulations may support planning. They must not be recorded as completed making or actual testing evidence.
