

MULTIMEDIA

Fast Food Futures

STUDENT WORKBOOK

Build an original connected brand

Name _____ Class _____

Illustrative brand concept • A4 • Print double-sided, long edge

MULTIMEDIA / READ, PRACTISE AND CREATE

Your course route

Develop an original fast-food business and connected digital brand. Read each section, apply its ideas, then build and check your own evidence. This book supports the course and your teacher's directions.

	Learning route	Pages
01	The design challenge	3–8
02	Visual language	9–13
03	Logo systems	14–18
04	Menu information design	19–23
05	Promotional poster	24–28
06	Brand applications	29–33
07	Motion advertising	34–38
08	Ethical marketing and systems	39–42
09	Web portfolio	43–45
10	Present, evaluate and improve	46–50

Use paper and the course together

Each reading includes one original application question. The same section online contains its other four questions, extended response and capstone. Follow the exact link printed with the reading. The activity bank contains the other practice activities; use the sequence your teacher gives you.

The eight folio stages keep your selected design decisions and evidence. A saved record, still image or filename does not complete actual animation production, playback, approved website access or hand-in. Use only the account, sharing and submission arrangements your teacher approves.

Keep your work and sources traceable

Keep an editable working file and suitable backups. Record sources and assistance, preserve original files, and label concept images and mock-ups honestly. The illustrations in this book are generated teaching examples, not actual student work or current software screens.

For typed answers in Word, select the handwriting-rule paragraphs inside a response cell and replace them. Cells can expand; recheck page breaks before printing an edited copy.

Online: <https://stevenowell.github.io/Year-7-Multimedia/folio.html>

MODULE 01 / THE DESIGN CHALLENGE

Problem, purpose and brief

A brief gives the project direction

A design problem is the situation that needs a useful response. The purpose explains why that response matters. A design brief joins these ideas into a concise statement of what will be developed, who it is for and what it should achieve. Fast Food Futures asks students to develop an original fast-food business and a connected digital brand. The brief guides the work; it is not a finished logo, poster or website.

Separate facts, choices and limits

The supplied brainstorm confirms decisions such as a business name, slogan, products, colours and target audience. It does not confirm exact required quantities, software accounts or publication settings. Its space for product ideas is a planning scaffold, not proof of a compulsory quantity. A responsible designer does not turn a genuine unknown into a project rule and follows authorised directions when they are supplied.

Figure 1. Illustrative brief-planning study. Purpose, audience, real constraints and intended outputs guide decisions before finished artwork.

Worked example: strengthen a vague brief

“Make a cool burger logo” is narrow and vague. A stronger draft is: “Develop an original visual identity for a fast-food business so its intended audience can recognise the business across a logo, menu, poster, motion advertisement and web portfolio.” This version names the connected outcome and audience purpose while leaving room for original decisions. Later ideas can be judged for recognition, consistency, readability and honesty.

Apply your understanding

A polished poster looks impressive but promotes a different audience and purpose from the brief. What is the strongest next step?

- a) Publish it because visual polish is the main success measure
- b) Add more effects while keeping the changed direction
- c) Identify the mismatch, revise key choices and retest

Online: <https://stevenowell.github.io/Year-7-Multimedia/modules/module-01.html#m01-s01>

MODULE 01 / THE DESIGN CHALLENGE

Users and target audiences

An audience is more than an age label

A target audience is the group a communication is designed to reach. Age can be relevant, but a useful profile also considers needs, interests, context, access and the action the communication should support.

“Teenagers” is too broad to guide many choices. “Students comparing options quickly on a small screen during a short break” gives clearer clues about reading size, information order and tone. These clues are hypotheses until research or feedback supports them.

Design for people, not stereotypes

Designers make weak assumptions when they treat a group as if everyone thinks the same way. A colour or phrase should not be chosen because “young people like it”. Explain the communication purpose and gather suitable evidence. Accessible choices such as readable type, clear contrast, captions and plain navigation widen participation. Accessibility is part of effective audience design, not decoration added at the end.

Figure 2. Illustrative research workspace. Compare needs and contexts before selecting a brand direction.

Worked example: profile to decision

If users need to compare products quickly, a designer might use clear category headings, brief names, aligned prices and one obvious action. Each choice answers a scanning need. Neon colours chosen only because the audience is young have no strong evidence. A useful justification makes the chain visible: audience evidence leads to a communication need, which leads to a design decision that can be tested.

Apply your understanding

Students will compare food options on phones during a short break. Which design response has the strongest audience-based reasoning?

- a) Use several decorative fonts because phone users enjoy variety
- b) Use clear headings and aligned details, then time a finding task
- c) Fill spare space with longer descriptions to appear complete

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-01.html#m01-s02>

MODULE 01 / THE DESIGN CHALLENGE

Original ideas and responsible AI

Originality is a traceable process

Original ideas can grow through observation, research, sketching, comparison and combination. Originality comes from purposeful choices for this brief rather than copying a finished brand. A mood board can collect colour, type, texture and image-treatment references, but should not become a page of logos to imitate. Record important sources and show how your own decisions change across drafts.

AI can suggest; the designer must decide

The supplied brainstorm permits AI for ideas only, followed by student selection and editing. A generated result is not automatically accurate, suitable or original. Check suggestions against the brief, reject stereotypes, verify factual claims and transform useful fragments through your own reasoning. Do not enter personal information, student images or controlled school material into a tool unless approved use is confirmed. Accounts and licence conditions remain teacher-controlled.

Figure 3. Illustrative decision trail: references are selected, sketched and transformed. The finished-looking starting idea does not replace student choices.

Worked example: keep a decision trail

A student requests words connected to “fast, fresh and playful”, circles two useful results, sketches three symbols, combines one with an original wordmark and tests it with the audience profile. Their note identifies the tool-assisted starting point and explains the changes. Copying a generated logo directly would hide the decisions. The trail makes the student’s contribution, checking and responsibility visible.

Apply your understanding

An AI tool suggests a slogan and an environmental fact for a proposed brand. What should the student record before using either?

- a) The source of assistance, checks, selection and student-made changes
- b) The final wording while leaving out the earlier decision trail
- c) A note that confident-sounding generated suggestions are likely accurate

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-01.html#m01-s03>

MODULE 01 / KNOWLEDGE CHECK

Brief or audience clue?

Sort each card into Confirmed brief, Audience evidence, Design choice or Not confirmed by the source. Then explain one card that was tempting to place elsewhere.

A Confirmed brief **B Audience evidence**
C Design choice **D Not confirmed by the source**

Original card	A–D
1. Develop an original fast-food business and connected digital brand	
2. Users may compare products quickly on a small screen	
3. Align comparable information to support scanning	
4. Every student must use exactly four brand colours	
5. Every logo must contain a burger symbol	
6. Select brand colours in the planning scaffold	

Ask what the source actually confirms and whether the statement describes a user, a possible response or a local rule.

Explain one difficult placement

Then explain one card that was tempting to place elsewhere.

Online: <https://stevenowell.github.io/Year-7-Multimedia/activities.html#act-m01-brief-audience-cards>

What should your audience understand, feel or do when they see this brand?

FOLIO 01 / REASONS BEHIND THE BRAND

Audience and original decisions

A clear brief gives every later design decision a purpose.

Target audience and their needs

Who are you designing for, and what matters to them?

How I kept the idea original (optional)

Explain what you selected, changed or developed yourself, including any responsible use of AI for ideas.

My audience is... / They need the brand to... / I kept the idea original by...

Project evidence only. Follow any separate formal task notice your teacher gives you.

Online: <https://stevenowell.github.io/Year-7-Multimedia/folio.html#folio-stage-brief-audience>

MODULE 02 / VISUAL LANGUAGE

Colour and meaning

Give each colour a job

Colour can attract attention, separate information and support recognition. A palette is a planned set of colours with roles, such as a main brand colour, support colour, background and text colour. Naming each role is more useful than choosing colours only because they look good together. Meaning changes with culture, context and surrounding imagery, so one colour cannot guarantee one message for every audience.

Contrast makes information perceivable

Contrast is the visible difference between elements. Test text and backgrounds at the real viewing size, in colour and greyscale, and on more than one screen when possible. A call to action may need stronger contrast than supporting detail. Never rely on colour alone for an essential category or choice; reinforce it with words, icons or patterns.

Figure 4. Illustrative palette comparison. Each direction repeats colour roles across several applications; appearance alone cannot prove audience suitability.

Worked example: assign roles before decorating

A student chooses deep green, warm cream and bright orange. Green carries large brand areas, cream provides calm reading surfaces and orange highlights one action. Dark text is tested on cream and cream text on green at poster and phone size. Orange text fails a small-size test, so orange remains an accent shape rather than carrying essential information. Repeated roles keep the palette recognisable.

Apply your understanding

A menu uses red for every heading, warning and price, but the same red has poor contrast on one background. Which revision is strongest?

- a) Keep the repeated red role even where its contrast is weak
- b) Add several brighter colours so each item attracts equal attention
- c) Refine the red role, use readable text and add non-colour cues

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-02.html#m02-s01>

MODULE 02 / VISUAL LANGUAGE

Typography and tone

Typography is a system

Typography includes typeface, size, weight, spacing, line length and alignment. These features work together to create hierarchy and tone. A display style may suit a short brand name but become tiring in a paragraph. A useful system gives distinct roles to the name, headings, product information and small details. Limiting styles makes those relationships easier to understand.

Tone must not defeat legibility

Rounded letters may feel informal and condensed capitals may feel forceful, but tone is an interpretation to test with the audience. Legibility concerns recognising characters; readability concerns following words comfortably. Decorative effects, tight spacing and long lines can reduce both. Essential names, prices and actions must remain clear at the size and distance where they will be viewed.

Figure 5. Illustrative type study. Large display characters and simpler information styles have different jobs. Compare weight, spacing and hierarchy.

Worked example: four clear roles

A poster uses one distinctive face for a two-word name and one plain face for the slogan, product details and action. The name is largest, the offer next and supporting detail smaller but readable. Weight and spacing strengthen the levels, so four unrelated fonts are unnecessary. A phone test shows the slogan is too thin, so its weight increases while the friendly tone remains.

Apply your understanding

A playful display font works for a two-word brand name but slows reading in product descriptions. What is the strongest type plan?

- a) Use the display font everywhere so the brand feels consistent
- b) Keep it for the name and use a tested clear face for details
- c) Replace the text descriptions with decorative letter samples

Online: <https://stevenowell.github.io/Year-7-Multimedia/modules/module-02.html#m02-s02>

MODULE 02 / VISUAL LANGUAGE

Hierarchy, layout and mood boards

Plan the first, next and later look

Visual hierarchy is the order in which elements attract attention. Size, contrast, position, spacing and repetition can make one message dominant and another supporting. It does not mean making everything large. If the logo, image, slogan, price and action all shout equally, there is no entry point. Rank information according to the communication purpose before styling it.

Layout creates relationships

Alignment and proximity show what belongs together. White space protects readability and can separate groups without boxing every item. A grid keeps edges and spacing consistent while allowing one focal element to break the pattern deliberately. The supplied canteen menu and poster can be analysed for grouping and scanning, but the menu's historical prices and products are not current information to republish.

Figure 6. Illustrative mood board. Colour, texture, type and image treatments form a direction; they are references to interpret, not a finished brand to copy.

Worked example: a mood board as filter

A useful mood board groups a small set of colours, type references, shapes, textures and image treatments around a direction such as “bold, quick and friendly”. The student annotates why each fits and removes attractive items that point elsewhere. The board becomes a filter for later choices. It guides original work; it is not copied into the final brand as a page of other people’s designs.

Apply your understanding

A poster gives the logo, product image, slogan, price and action equal size and contrast. What should the designer do first?

- a) Rank the information by purpose, then adjust visual weight
- b) Add boxes around the main elements to make each one prominent
- c) Centre the elements while keeping their current emphasis

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-02.html#m02-s03>

FOLIO 02 / SELECTED PROJECT EVIDENCE

Visual direction and success criteria

Set a visual direction and write criteria you can use to judge the brand.

How will your visual choices make the brand suitable and easy to recognise?

Add your mood board or visual-direction image

Image caption - what does this evidence prove?

Explain the useful ideas shown in your mood board or visual-direction image.

Colour palette and intended meaning

Name the main colours and explain what they communicate.

FOLIO 02 / VISUAL DECISIONS

Type and observable success

Colours, type and layout work better when they are chosen for the audience, not just personal taste.

Typography and tone

Describe the type style and the tone it creates.

Success criteria

Write 3-5 checks that can be observed in the finished brand.

The palette suits the audience because... / The typeface creates a... tone. / A successful design will...

Selected design-process evidence only. It is not automatically marked or submitted.

Online: <https://stevencowell.github.io/Year-7-Multimedia/folio.html#folio-stage-visual-direction>

MODULE 03 / LOGO SYSTEMS

Symbols and recognition

Figure 7. Illustrative concept development. Small changes in positive and negative shapes create genuinely different symbols before one direction is refined.

A logo identifies

A logo is a compact identifier used across brand applications. It might be a wordmark, symbol or combination, but its main job is recognition rather than telling the whole business story. A useful concept grows from the brief: a shape, letterform or relationship can connect to the business name, tone or audience. Packing every product, message and effect into one mark usually weakens quick recognition.

Familiar is not permission to copy

Simple shapes can feel familiar, but they must still be developed into a distinctive response. Changing the colour of a famous logo or tracing its shape does not create original work. Compare concepts by silhouette, name connection and likely confusion with existing brands. Keep sketches and decision notes so the development from source idea to student-made mark remains visible.

Worked example: simplify the relationship

“Orbit Bites” begins as a detailed drawing of a meal, stars, a planet and three text lines. The designer finds the strongest relationship: a circular bite can also suggest an orbit. They sketch several versions, combine the best symbol with an original wordmark and remove details that vanish at small size. Simplicity is useful when it makes the intended relationship easier to recognise and distinguish.

Apply your understanding

A first logo sketch includes a burger, drink, slogan, business story and five effects. Which redesign approach best protects recognition?

- a) Shrink the existing details until they fit inside a compact badge
- b) Trace a familiar takeaway logo and replace its colours
- c) Develop several simple name-linked forms and compare silhouettes

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-03.html#m03-s01>

MODULE 03 / LOGO SYSTEMS

Scale, contrast and simplicity

Figure 8. Illustrative scale study. Fine lines and narrow gaps compete as the mark gets smaller. The simpler version keeps more of its main silhouette.

Test realistic sizes

A logo that works on a large poster may fail as a small site icon or uniform mark. Scale testing reveals thin lines, tiny gaps and small text that disappear. View the mark at realistic output sizes instead of assuming that screen zoom proves success. The identifying shape should remain clear even if supporting detail is reduced. The test provides evidence for actual uses; it does not invent one compulsory minimum size.

Test colour and one-colour versions

A full-colour logo can depend too heavily on one background. Test light, dark and visually busy contexts, plus a one-colour version that preserves the key silhouette. If a photograph interferes, a controlled clear area or alternate version may be stronger than several shadows and outlines. Contrast should separate the mark without burying its shape in effects.

Worked example: three-part stress test

Orbit Bites is tested as a large poster mark, a phone header and a one-colour stamp. The slogan disappears on the phone, so the compact version removes it. The planet edge is lost over a busy photograph, so a simple high-contrast holding shape is used. The circular bite remains in every version. These are controlled variants of one identity, not unrelated replacement logos.

Apply your understanding

A logo passes on a white poster but fails on a dark uniform and a busy phone header. Which test plan is strongest?

- a) Design a different symbol for each background and application
- b) Test one-colour and holding-shape variants in both contexts
- c) Judge the enlarged logo on screen and skip realistic outputs

Online: <https://stevenowell.github.io/Year-7-Multimedia/modules/module-03.html#m03-s02>

MODULE 03 / LOGO SYSTEMS

Logo variants and critique

Figure 9. Illustrative identity applications. The same circular and square relationship remains visible at different scales and in different contexts.

Variants solve placement problems

A primary logo may include the full name and symbol. A compact version can rearrange or remove supporting text for a narrow space, while a one-colour version suits limited-colour contexts. Versions should share a core shape, type relationship or other identifying feature. A collection of unrelated marks is not a system because the audience must relearn the identity each time.

Critique the work, not the person

Useful critique describes observable evidence, links it to a criterion and suggests a question or action. “I don’t like it” gives no direction. “The name is difficult to read at phone size; could the compact version increase spacing or remove the slogan?” identifies context and a test. The designer records feedback and explains what was accepted, adapted or rejected against the brief.

Worked example: compare before choosing

Three concepts appear at identical sizes on the same light and dark backgrounds. Reviewers consider recognition, brief connection, originality and readability. Concept B is popular but resembles an existing brand. Concept C has a clearer name connection and lower confusion risk, so it is selected and its small-size spacing refined. Selection follows relevant evidence rather than a vote alone.

Apply your understanding

Peer feedback says, ‘The icon feels crowded at phone size; test the symbol without the slogan.’ How should the designer respond?

- a) Test the suggestion, record the result and decide against the brief
- b) Accept it without testing because peer feedback reflects the audience
- c) Reject it as personal preference without checking the size problem

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-03.html#m03-s03>

FOLIO 03 / SELECTED PROJECT EVIDENCE

Logo system

Present your original logo and explain why it works for the brand.

Which visual decision does the most work in making your logo recognisable?

Add your final logo or a useful logo comparison

Image caption - what does this evidence prove?

State what this logo version demonstrates.

Scale and contrast check

What happened when you viewed it small, large or on a different background?

FOLIO 03 / RECOGNITION AND CHECKING

Explain and refine the logo

A strong logo needs to remain recognisable at different sizes and in different contexts.

Logo rationale

Explain the symbol, colour and typography choices.

Change made after checking (optional)

Describe one change and why it improved the logo.

The logo is recognisable because... / At a small size I noticed... / I improved the logo by...

Student-created evidence only. The software demonstration is support, not assessment criteria.

Online: <https://stevenowell.github.io/Year-7-Multimedia/folio.html#folio-stage-logo-system>

MODULE 04 / MENU INFORMATION DESIGN

Grouping and information architecture

Information architecture makes content findable

Information architecture is the planned grouping, naming and order of content. Before styling a menu, list the information users need and sort related items into categories. Category labels should use words the intended audience can understand. A menu is not clearer simply because every item has a box; clear headings, consistent order and useful spacing can make relationships visible with less clutter.

Read the source as a layout example

The supplied WWHS canteen menu is authorised for analysing visible grouping, headings, price alignment and scanning. It is not current authority for prices or product availability. Students should view the complete image, describe what is observable and separate those observations from judgements. “Items are grouped under headings” is observable; “this is the best possible menu” is an unsupported judgement until criteria and users are considered.

Meals

Related main items

Drinks

Comparable drink choices

Sides

Supporting items

Promotions

Clearly labelled offers

Figure 10. A source-based grouping model. Choose category names from how users search; the categories organise content rather than prescribing products.

Worked example: card sort before layout

A draft list mixes meals, drinks, sides and promotional items. The designer writes each entry on a card, groups cards by the way users are likely to search, tests category names with another person and then orders groups from common choices to supporting items. One product could fit two groups, so it is placed once under the label users find fastest. This avoids duplicates and turns content structure into a reasoned decision.

Apply your understanding

A draft menu places the same wrap under ‘Meals’, ‘Quick Bites’ and ‘Specials’. What is the strongest information-architecture decision?

- a) Keep three copies so each category appears well stocked
- b) Remove the headings and arrange the item list alphabetically
- c) Test the category labels and place the wrap once

Online: <https://stevenowell.github.io/Year-7-Multimedia/modules/module-04.html#m04-s01>

MODULE 04 / MENU INFORMATION DESIGN

Readability and scanning

Scanning is different from close reading

People often scan a menu for headings, familiar item names and aligned details before reading a description. The layout should provide landmarks: repeated heading styles, predictable item order and consistent alignment. Price or other comparable information is easier to inspect when its position is stable. A clear scan path does not remove useful detail; it helps users decide where closer reading is needed.

Protect readable information

Type size, line spacing, contrast and line length affect reading. Long centred descriptions can be harder to follow than short, aligned blocks. Decorative backgrounds may make a menu feel on-brand but should not reduce text contrast. Test the design at its intended print or screen size, not only while zoomed in. Ask a user to find a named item and explain where their attention went.

Worked example: a five-second finding test

1 Set the task

A reviewer is asked to find a drink, a main item and a price without being coached.

2 Notice the error

They find the headings but repeatedly lose the matching price because dotted lines are irregular.

3 Change the relationship

The designer moves all prices to one aligned column and increases space between categories.

4 Retest

A second test is faster and produces fewer errors.

5 Judge from evidence

The improvement is supported by observable finding behaviour rather than appearance alone.

Figure 11. Illustrative category landmarks make the three groups visible. The worked example tests a different relationship: matching each item to its price. No current products or prices are shown.

Apply your understanding

In a five-second test, users find category headings but match two products to the wrong prices. Which revision best responds to the evidence?

- a) Add texture behind the product rows to strengthen the visual style
- b) Stabilise the price column and increase separation between rows
- c) Replace category headings with larger promotional photographs

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-04.html#m04-s02>

MODULE 04 / MENU INFORMATION DESIGN

Honest product information

Accuracy is part of information design

A clear menu can still mislead if its words, prices or images do not match the actual offer. Product names and short descriptions should distinguish items without making unsupported health, environmental or quality claims. Draft prices or availability must be checked against the current authorised source before publication. The supplied canteen image helps with layout analysis only and must not be copied as a current list.

Images also make claims

A large image can imply size, ingredients or presentation even without written promises. Cropping and mock-ups should not hide important differences between the designed concept and what is actually offered. If a graphic is an illustration, concept or context test, label it honestly. Essential information should be prominent enough to find, not buried in low contrast or tiny type.

Figure 12. Illustrative claim-checking workspace. Attractive food imagery and a leaf symbol do not establish ingredients, health benefits or environmental performance.

Worked example: revise an unsupported claim

A menu draft says “the planet’s greenest fries” because the palette is green. No evidence supports the statement. The student removes the claim and replaces it with a factual description of the proposed product, then records the environmental idea as a question for later investigation. The menu becomes less dramatic but more trustworthy. Strong promotion can still be vivid without pretending an unverified benefit is a fact.

Apply your understanding

A menu mock-up shows an illustrated meal much larger than the proposed serving and calls it ‘the healthiest choice’. What should happen before publication?

- a) Revise or label the image and verify or remove the health claim
- b) Keep both because promotional designs are allowed to exaggerate facts
- c) Reduce the type size so the unsupported claim seems less prominent

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-04.html#m04-s03>

FOLIO 04 / SELECTED PROJECT EVIDENCE

Menu information and honest marketing

Organise menu information and explain one honest, responsible marketing choice.

How did you make important information easy to find and claims easy to trust?

Add your menu or a close view of its information hierarchy

Image caption - what does this evidence prove?

Point to the hierarchy or honest-information choice visible in the image.

Information hierarchy

Explain how headings, groups, spacing or alignment help people scan the menu.

FOLIO 04 / HONESTY AND IMPROVEMENT

Make information trustworthy

Customers should be able to scan information quickly without being misled.

Honest marketing decision

Explain one claim, image or choice you checked so it would not mislead the audience.

One improvement after testing (optional)

What did a reader find difficult, and what did you change?

Readers see... first because... / I grouped... together so... / I avoided a misleading claim by...

The historical canteen image is an information-design example, not authority for current products or prices.

Online: <https://stevenowell.github.io/Year-7-Multimedia/folio.html#folio-stage-menu-ethics>

MODULE 05 / PROMOTIONAL POSTER

Composition and focal point

Composition arranges attention

Composition is the deliberate arrangement of image, type, shape and space. A poster is usually seen quickly, so it needs an entry point. The focal point is the element intended to attract attention first; hierarchy then guides the viewer to the next information and action. A large element is not automatically useful if it distracts from the poster's purpose.

Balance energy with control

Visual weight comes from size, contrast, colour, detail and position. Symmetrical layouts can feel stable, while asymmetrical layouts can create energy, but neither is automatically better. Alignment and space keep relationships understandable. Test the poster from a distance and at thumbnail size. Squinting or viewing in greyscale can reveal whether several elements compete for first attention.

Figure 13. Illustrative focal-point comparison. Several bursts compete on the left; the right protects a clearer product area. A calm layout still needs honest words.

Worked example: design a three-step path

The source poster can be examined as a complete composition. A student plans the path “product image → offer → brand and action”. The product image receives the strongest scale contrast, the offer sits nearby, and the logo has a clear but supporting position. A decorative burst competes with the offer, so it is reduced. The revision improves the intended path without copying the source poster's brand content.

Apply your understanding

A distance test shows viewers notice a decorative badge before the product and offer. Which response best protects the poster purpose?

- a) Increase the badge contrast so its role is unmistakable
- b) Increase several elements so the layout feels more energetic
- c) Reduce or reposition the badge, then repeat the distance test

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-05.html#m05-s01>

MODULE 05 / PROMOTIONAL POSTER

Image selection and background removal

Choose an image for its teaching job

An image should support the poster's message and audience, not merely fill space. Check subject relevance, viewpoint, lighting, resolution, permission and whether the scene communicates an honest scale and condition. Use original or authorised material and record attribution where required. Avoid personal details, identifying student imagery and signed-in dashboard captures in public-facing graphics.

Background removal changes the edge

Removing a background isolates a subject so it can sit within a new composition. The edge needs close inspection around hair, packaging, shadows and transparent areas. A jagged halo or missing piece weakens credibility. Background removal should not distort the subject or imply a false product condition. Sometimes retaining a real background is the more honest and useful choice.

Figure 14. Illustrative edge check. Compare the full context, a light background, a dark background and a coloured background to reveal a halo or missing edge.

Worked example: edge and context check

A product photograph has a busy bench behind it. The student duplicates the original, removes the background from the working copy and checks the edge on both light and dark test colours. A grey halo appears, so the mask is refined. They keep the original photograph in the process record and compare both versions. The cut-out supports the poster hierarchy, while the original preserves the actual context.

Apply your understanding

A product photograph has an authorised source and useful real-world scale, but its background is slightly busy. What is the strongest decision process?

- a) Remove the background immediately because promotion requires isolation
- b) Test both versions, judge hierarchy and honesty, then record the choice
- c) Crop tightly until the scale and surrounding condition are hidden

Online: <https://stevenowell.github.io/Year-7-Multimedia/modules/module-05.html#m05-s02>

MODULE 05 / PROMOTIONAL POSTER

Calls to action and mock-ups

A call to action gives a next step

A call to action tells the audience what to do next, such as view the menu, explore products or visit the portfolio. It should be brief, specific and visible without overpowering the main message. The action must match what is actually available. “Order now” would be misleading if no ordering system exists. The brief and publishing context should control the wording.

A mock-up is a context test

A mock-up places artwork into a simulated location such as a poster frame, outdoor sign or street display. It can reveal scale, contrast, crop and viewing-distance problems. It is not proof that the design was manufactured, purchased or displayed publicly. Label mock-ups as context views and preserve the original flat artwork so viewers can judge the design itself.

Figure 15. Illustrative poster concepts in flat and street-frame contexts. They help compare scale and hierarchy; these generated mock-ups are not proof of public display.

Worked example: compare three contexts

The Drive set contains one full poster and three context mock-ups. A student compares all four: the flat poster shows complete detail, one outdoor view reveals that the action is too small, and a street view shows background colours competing with the logo. They enlarge the action slightly and use a controlled logo variant. The mock-ups diagnose context problems; they are not copied as evidence of the student's own public campaign.

Apply your understanding

A poster says ‘Order now’, but the project only provides a viewable menu and portfolio. Which call to action is most responsible?

- a) View the menu and explore the brand portfolio
- b) Order now and receive your meal within five minutes
- c) Act immediately before this exclusive offer disappears

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-05.html#m05-s03>

FOLIO 05 / SELECTED PROJECT EVIDENCE

Promotional poster in context

Present your poster in context and explain how it directs attention.

What should the audience notice first, second and third, and how did you make that happen?

Add your poster or a context mock-up

**Image caption - what does this evidence prove?**

Explain what this poster or mock-up demonstrates.

Context check

Explain what worked or became difficult to read in the mock-up context.

FOLIO 05 / ATTENTION AND REVISION

Explain the viewing order

A design can look different once it is placed where an audience will actually see it.

First, second and third viewing order

Describe the intended viewing order and the visual choices that create it.

Change made after the context check (optional)

Describe one improvement and why it was needed.

The first thing viewers notice is... because... / In context, I found... / I changed... so that...

The Drive poster is an exemplar. Students must submit their own original work.

Online: <https://stevenowell.github.io/Year-7-Multimedia/folio.html#folio-stage-poster-context>

MODULE 06 / BRAND APPLICATIONS

Consistent identity

Consistency is a pattern of decisions

A consistent identity repeats meaningful relationships: logo treatment, palette roles, type hierarchy, image style and tone. Consistency does not require every output to have the same layout. A menu and a uniform solve different problems, but the audience should still recognise the same brand. A short style guide records the stable rules and the variations allowed for different contexts.

Repeat the core, adapt the application

Rigid repetition can make a design unsuitable. A vertical poster logo may need a compact uniform version; a detailed image style may be inappropriate for a small embroidered area. Adaptation is controlled when the reason is visible and the core identity remains. Test applications side by side to find accidental changes in colour, spacing, type or tone.

Figure 16. Illustrative connected brand. Repeated colour and shape relationships connect the bag, cup and wrapper without giving them identical layouts.

Worked example: an application matrix

A student creates a table with logo version, colour role, type role and image treatment for the menu, poster, motion ad, uniform and site. The uniform uses a compact one-colour mark because the full slogan is unreadable. The site keeps the full palette and primary logo. The matrix shows why the difference is controlled. An accidental purple heading on one page is corrected because it has no defined system role.

Apply your understanding

A menu keeps the approved logo and colours but introduces an unrelated decorative typeface for every heading. What is the strongest response?

- a) Keep it because varied applications benefit from a noticeably fresh style
- b) Replace the menu layout with the exact poster arrangement
- c) Restore an approved type role while retaining the useful menu layout

Online: <https://stevenowell.github.io/Year-7-Multimedia/modules/module-06.html#m06-s01>

MODULE 06 / BRAND APPLICATIONS

Designing a staff uniform

Start with communication purpose

A staff-uniform concept can identify the business and connect staff with the visual identity. The source verifies a Canva demonstration of applying the identity to a uniform concept, but it does not confirm a required garment, supplier, material, production method or school licence. Treat the output as a design concept unless the teacher supplies further production facts.

Placement changes recognition

A mark placed on a moving person is viewed from varied distances and angles. Test front, back or other proposed positions for visibility without assuming that every position is required. Large graphics may dominate or fold across garment shapes; tiny marks may disappear. Use a suitable logo variant, preserve clear area and check contrast against the garment colour.

Figure 17. Illustrative staff-uniform concepts. Compare contrast and mark placement on different garment shapes. No garment or manufacturing method is required by this image.

Worked example: compare two placements

A student tests the full logo across the front and a compact mark in a smaller upper-area position. The full version distorts over the mock-up shape and its slogan becomes hard to read. The compact version stays clear but needs stronger colour contrast. The student selects the second direction and records that real manufacture, material performance and exact placement remain outside this digital concept evidence.

Apply your understanding

A compact mark disappears against a dark cap when the concept is viewed at normal size. What should the designer do next?

- a) Add the full slogan and reduce the complete logo further
- b) Strengthen the mark's contrast and retest it at a realistic size
- c) Approve manufacture because the motif is visible when enlarged

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-06.html#m06-s02>

MODULE 06 / BRAND APPLICATIONS

Checking suitability and accessibility

Suitability depends on users and context

A visually consistent application can still be unsuitable if it is difficult to recognise, uncomfortable in tone or inaccessible. Review the concept against its audience profile and use context. Consider reading distance, contrast, image meaning, respectful representation and whether essential information survives. Do not assume that one reviewer represents the whole audience.

Check more than colour

Accessibility checks include contrast, clear shapes, readable text and cues that do not depend on colour alone. On a uniform concept, a simple mark may be more recognisable than small supporting text. Use privacy-safe silhouettes or mock-ups rather than identifiable student photographs. If real-user testing is possible under approved arrangements, ask focused questions and avoid collecting unnecessary personal data.

Figure 18. Illustrative greyscale comparison. Differences in tone, shape and pattern can carry information when colour is unavailable.

Worked example: test, explain, revise

Two reviewers identify the business from the front concept, but neither can read the slogan at the proposed size. One reviewer also confuses two low-contrast palette colours. The designer removes the slogan from the compact version and strengthens contrast while preserving the main palette roles. They report the small test honestly and do not claim universal accessibility from two responses.

Apply your understanding

A uniform concept uses two similar colours as the only way to distinguish staff roles. Which revision is most suitable?

- a) Add a clear role label or symbol, then retest colour contrast
- b) Keep the colour-only system and provide a short explanatory key
- c) Add a third similar colour and leave the roles otherwise unlabelled

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-06.html#m06-s03>

FOLIO 06 / SELECTED PROJECT EVIDENCE

Staff uniform brand application

Apply the visual identity to a staff-uniform concept and justify the choices.

How does the uniform belong to the same brand while still working as clothing for staff?

Add your staff-uniform concept

Image caption - what does this evidence prove?

Explain the brand application visible in this uniform concept.

Brand consistency

Explain how colour, logo placement and type connect the uniform to the brand.

FOLIO 06 / SUITABILITY AND ACCESS

Check the application

A brand system should remain consistent and usable beyond a single logo or poster.

Suitability and accessibility

Explain a readability, contrast, comfort or role-suitability decision.

One checked improvement (optional)

What did you change after comparing the uniform with the rest of the identity?

This belongs to the brand because... / The placement works because... / I checked contrast by...

The folio records a design decision, not teacher-observed practical competence.

Online: <https://stevenowell.github.io/Year-7-Multimedia/folio.html#folio-stage-uniform-application>

MODULE 07 / MOTION ADVERTISING

Frames, states and transitions

Figure 19. Illustrative state plan. Follow the same main image as its scale and position change; the arrows communicate a sequence, not actual playback.

Motion begins with states

A state is one planned arrangement of elements at a point in an animation. The start and end states show what changes: an image may move, a logo may scale or a message may enter. A transition creates the visible change between states. Clear planning begins with what the audience should notice before, during and after the movement, not with choosing the most dramatic effect.

Movement should preserve continuity

Viewers follow motion more easily when the same element remains recognisable across states. Sudden unrelated changes can break attention or hide the message. Direction, distance, scale and order affect meaning. Keep essential text on screen long enough to perceive and avoid simultaneous movement that competes with the focal message. Motion should strengthen hierarchy rather than reset it every second.

Worked example: a three-state storyboard

State 1 establishes the product image and background. State 2 moves the product to make room for the logo and slogan. State 3 introduces the price element and action while the logo remains stable. Arrows show movement and notes explain the attention goal. The storyboard can be checked before software work, reducing random experimentation and giving the finished MP4 an evidence-based plan. The supplied 16-second Drive clip does not show a finished animation, so it cannot be used as the comparison exemplar.

Apply your understanding

A motion ad moves the product, logo, slogan and price in different directions at the same time, and viewers miss the price. What is the strongest revision?

- a) Increase the speed so viewers see the complete movement sooner
- b) Add another transition so each moving element appears more active
- c) Hold the identity stable and sequence the product and price changes

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-07.html#m07-s01>

MODULE 07 / MOTION ADVERTISING

Match and Move

Figure 20. Illustrative state study: the bowl stays stable while the circle shifts. Planning images do not show a software interface or prove playback.

The verified workflow

The Drive demonstration shows a 1080×1920 portrait advertisement with background or gradient, selected imagery, logo, slogan and price element. It duplicates states, changes element positions or sizes, applies Match and Move, adjusts timing and exports MP4. These are verified features of the demonstration. The canvas size is demonstrated rather than a universal rule unless the teacher confirms it for the class output.

Match elements across states

Match and Move works best when the software can recognise corresponding elements in the before and after states. Duplicating a state helps preserve that relationship. Move or resize only what serves the planned transition, and check which elements should remain stable. If an object is replaced by a different one, the result may behave differently from a continuous move. Preview after each meaningful change.

Worked example: diagnose an unexpected transition

A product image should slide left and shrink, but it fades out and a second image appears. The student checks the two states and finds that the image was deleted and reinserted instead of carried across the duplicate. They restore the shared element, change its position and scale, and preview again. The corrected transition communicates one object changing state rather than two unrelated objects swapping.

Apply your understanding

A product should slide left, but the preview shows one image fading out and another appearing. Which edit best addresses the cause?

- a) Export immediately and correct the movement in the video player
- b) Restore the shared image, then change its position in the duplicate
- c) Replace the product with two different images in both states

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-07.html#m07-s02>

MODULE 07 / MOTION ADVERTISING

Timing, export and quality checks

Figure 21. Illustrative export-check workspace. A storyboard, an editable file and a playable exported video are different evidence; a still picture cannot prove timing.

Timing controls comprehension

Timing includes how long a state remains visible and how quickly a transition occurs. Fast motion can create energy but may prevent reading; slow motion can weaken urgency. Test the complete sequence without pausing and ask what a viewer can recall. Essential text needs enough time to be perceived. Avoid flashing or rapid effects that add discomfort without a clear communication purpose.

Run a pre-export inspection

Before export, check order, crop, spelling, logo consistency, text contrast, safe-area placement and whether the final state gives a clear ending. Preview at the intended screen shape. Keep an editable working file as well as the exported version, use a meaningful file name and confirm the MP4 opens. Saving or exporting on one device does not submit the file to a teacher.

Worked example: compare plan and export

The storyboard expects the slogan to remain visible while the price enters. In the exported preview, the slogan vanishes too early and the last state ends abruptly. The designer extends the slogan state, adds a brief final hold and exports again. They compare the new MP4 with the plan and record the change. The supplied 0:16 clip only opens a blank A4 Canva document, so the verified tutorial, storyboard and the student's own playback check provide the useful comparison evidence.

Apply your understanding

An exported MP4 opens, but its action button is partly cropped in the intended phone-shaped preview. What should happen next?

- a) Return to the editable file, correct safe-area placement, re-export and reopen
- b) Keep the file because opening successfully is the main quality measure
- c) Rename the cropped MP4 and record it as a completed submission

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-07.html#m07-s03>

FOLIO 07 / SELECTED PROJECT EVIDENCE

Motion advertisement

Record how your motion advertisement changes over time and how you checked the export.

How does the movement guide attention without making the message harder to understand?

Add one useful still frame or storyboard image

This folio accepts one still image, not the MP4. Your video remains in its original file or school-approved location and is not included in folio backup, submission export or print.

Image caption - what does this evidence prove?

Explain what this still frame or storyboard view shows.

Original MP4 filename

FOLIO 07 / ACTUAL EXPORTED EVIDENCE

Record motion and playback

Motion design depends on clear states, timing and a working file, not just one attractive frame.

States, transition and timing

Describe what changes, the transition used and why the timing suits the message.

Export and playback check

Record where you played the MP4, what worked and what you fixed.

The first state shows... / The Match and Move transition helps because... / I checked the exported MP4 by...

A still image and filename do not prove the MP4 was submitted. Follow the teacher's approved video-submission direction.

Online: <https://stevencowell.github.io/Year-7-Multimedia/folio.html#folio-stage-motion-advertisement>

MODULE 08 / ETHICAL MARKETING SYSTEMS

Persuasion and target groups

Persuasion directs attention and action

Marketing can use imagery, colour, framing, social proof, scarcity language and calls to action to influence decisions. Persuasion is not automatically dishonest; a clear poster can help people notice and understand an offer. Ethical concern grows when a message hides important information, exploits a vulnerable audience or creates an impression that evidence cannot support. The designer must consider both intention and likely effect.

Targeting increases responsibility

Audience knowledge makes communication more relevant, but it can also make pressure more precise. Avoid stereotypes and do not collect unnecessary personal data. Ask whether the audience can recognise the message as promotion, whether the next step is genuinely available and whether the design respects their ability to decide. Strong design can persuade without pretending that every person needs the product.

Figure 22. Illustrative promotional comparison. Bursts, a clock and product scale can suggest pressure, but wording and evidence must also be checked before judging honesty.

Worked example: promotion or pressure?

“Explore our new menu” offers a clear next step. “Everyone has already bought it — don’t be the only one left out” uses social pressure and an unsupported claim. A student rewrites it as “See the new product range and decide what suits you.” The revised line still invites action but removes fabricated popularity and exclusion pressure. The design remains energetic through hierarchy and imagery rather than misleading wording.

Apply your understanding

A poster says, “Everyone is buying it now”, but no evidence supports the popularity claim. Which revision keeps a useful marketing purpose?

- a) Move the sentence into smaller text beneath the product image
- b) Add more people to the image so the popularity seems believable
- c) Describe a supported benefit and invite viewers to explore the range

Online: <https://stevenowell.github.io/Year-7-Multimedia/modules/module-08.html#m08-s01>

MODULE 08 / ETHICAL MARKETING SYSTEMS

Greenwashing and truth

Greenwashing creates a misleading environmental impression

Greenwashing occurs when communication makes a product, service or organisation appear more environmentally responsible than the evidence supports. It can use vague words, nature imagery, selective facts or claims with no clear measure. A green palette alone is not proof of greenwashing, but colour can contribute to a misleading impression when paired with unsupported environmental language.

Test the claim, scope and evidence

Ask exactly what is being claimed, what part of the business it covers, how it is measured and whether a suitable source can verify it. “Eco-friendly” is vague. A narrower statement may be checkable if the exact action and comparison are identified. If evidence is unavailable, remove the claim or frame it as a proposed improvement rather than a completed achievement.

Figure 23. Illustrative environmental-claim check. Leaves, green colours and paper textures do not prove an environmental benefit; the claim needs defined scope and evidence.

Worked example: from halo to evidence question

A poster says “100% sustainable brand” beside leaves and a recycling symbol. The claim covers the entire business but has no measure or source. The student removes it and writes an investigation question: “What packaging choice could reduce material use, and what evidence would show the reduction?” The green imagery is also reviewed so it does not continue implying a result that has not been demonstrated.

Apply your understanding

A package poster says “zero-waste choice” beside leaf icons, but no measure or source is available. What is the strongest next step?

- a) Keep the words and remove one leaf so the impression is less strong
- b) Remove the claim or turn it into a specific investigation question
- c) Replace the icons with a green border and leave the claim unchanged

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-08.html#m08-s02>

MODULE 08 / ETHICAL MARKETING SYSTEMS

Ripple effects and designer responsibility

A business is a connected system

The supplied investigation treats the simulated business as connected sectors rather than isolated tasks. A change in marketing can alter demand; demand can affect operations, resources, customer experience and public response. A ripple effect is an indirect consequence that moves through these connections. The exact result should not be guessed as certain: map a plausible pathway and identify what evidence would confirm it.

Designers influence the system

A designer chooses how information is framed, which audience is targeted and which impacts are visible or hidden. They may not control every business decision, but they are responsible for raising concerns, checking claims and communicating limitations. Ethical responsibility includes likely environmental, social and economic effects, not just whether a graphic looks effective.

Worked example: trace a demand ripple

1 Start with a decision

A campaign creates a sharp increase in demand.

2 Trace a plausible pathway

A plausible chain might be: more orders → greater workload and resource use → longer wait times or more waste if preparation cannot adjust → customer complaints → pressure for another communication response.

3 Name the uncertainty

Each arrow is a hypothesis, not a guaranteed fact.

4 Choose responsible action

The designer can ask whether the campaign promise, target and pace are responsible, then recommend monitoring evidence before repeating it.

Figure 24. Illustrative business context. A campaign can affect orders, workload and resource use. Packaging appearance alone cannot establish the actual consequences.

Apply your understanding

A campaign could sharply increase orders before the simulated business knows whether it can manage demand. What is the most responsible design response?

- a) Flag the capacity risk, limit unsupported urgency and monitor actual demand evidence
- b) Promise immediate service because stronger wording may increase engagement
- c) Treat operations as outside the design team's communication decision

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-08.html#m08-s03>

MODULE 08 / APPLIED THINKING

Ripple-effect chain

Build a four-step chain from one marketing decision. Label each arrow Confirmed link, Plausible assumption or Evidence needed, then add affected stakeholders.

Choose one starting decision

- Increase urgency in the campaign
- Make a broad green claim
- Target a narrower audience
- Change the promoted product

Use 'may' for a plausible consequence. Do not present the simulation pathway as a guaranteed real-world result.

1.

↓ Link 1: Confirmed link / Plausible assumption / Evidence needed

2.

↓ Link 2: Confirmed link / Plausible assumption / Evidence needed

3.

↓ Link 3: Confirmed link / Plausible assumption / Evidence needed

4.

Three affected stakeholders

1.

2.

3.

What responsible action can the designer take?

Online: <https://stevenccowell.github.io/Year-7-Multimedia/activities.html#act-m08-ripple-chain>

MODULE 09 / WEB PORTFOLIO

Site structure and navigation

Figure 25. A source-based site map. The demonstrated pages are Home, Products and Contact Us; actual access and contact details stay teacher-controlled.

Pages give related content a home

A site structure groups related information into pages and sets a useful order. The Drive demonstration shows a blank Google Site developed with Home, Products and Contact Us pages. This is verified source workflow for the unit. Home establishes identity and orientation, Products presents relevant brand outputs, and Contact Us provides the intended contact area. Any real contact details must follow teacher-approved privacy arrangements.

Navigation should be predictable

Navigation labels should match page content and remain consistent. Users need to know where they are, what each link means and how to return. A page called “Stuff” gives weaker guidance than “Products”. Avoid dead ends, duplicate pages and links whose visible label does not match the destination. Test every main link from more than one page and at phone width.

Worked example: a three-page card sort

Cards labelled logo story, poster, motion advertisement, product information, brand introduction and approved contact pathway are sorted under the three demonstrated pages. The logo story and introduction fit Home; product information and media fit Products; the approved pathway fits Contact Us. One card could fit two places, so a short link points to the main location instead of duplicating content. A peer predicts each destination before opening it.

Apply your understanding

During a finding test, most reviewers look under Products for a poster that is stored only on Contact Us. What is the strongest revision?

- a) Rename Contact Us as Stuff so the page can hold mixed content
- b) Copy the complete poster to Home and leave Contact Us unchanged
- c) Place the poster under Products and add a useful cross-link if needed

Online: <https://stevenccowell.github.io/Year-7-Multimedia/modules/module-09.html#m09-s01>

MODULE 09 / WEB PORTFOLIO

Preparing and embedding media

Figure 26. Illustrative media and device check. A display that works for its owner still needs an approved-viewer test; these screens are concepts, not a live service interface.

Prepare media before placing it

Choose the correct file, crop only working copies, check resolution and use meaningful file names. Compress a copy when needed so pages do not carry unnecessarily large files, while preserving the best-quality original. Add concise alternative text that describes the important visible content. Captions can explain the design purpose or identify a mock-up as a simulated context.

Embedding does not remove access rules

The source demonstration shows inserting posters and Drive video into Google Sites. Embedded media still depends on its sharing and privacy settings. A teacher-visible Drive file is not automatically public, and an embed that works for the owner may fail for another viewer. Use the approved access setting, provide a clear fallback when authorised and avoid exposing account details or signed-in interface frames.

Worked example: an independent-viewer test

The site owner sees an embedded MP4, but a reviewer using a different approved view sees an access message. The student does not change sharing without permission. They record the failed test, ask which access level is authorised and prepare a clear placeholder or teacher-approved fallback. An image also lacks alt text, so it is revised to describe the actual poster rather than saying only “poster image”.

Apply your understanding

The site owner can play an embedded video, but an approved independent viewer receives an access request. What should the student record and do?

- a) Record a pass because the media works in the owner's signed-in view
- b) Record the failure, confirm the authorised setting and prepare a safe fallback
- c) Publish the owner's edit link so the viewer can request access directly

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-09.html#m09-s02>

MODULE 09 / WEB PORTFOLIO

Publishing, access and submission

Figure 27. Illustrative responsive concept, not a Google Sites interface or an access test. Its short contact label is a sample; the demonstrated course page is Contact Us.

These states are different

Preview shows how the site may appear before publication. Publishing creates or updates an accessible site version under selected settings. Access determines who can view it. The source demonstration includes preview, publish and link checking, but the permitted audience setting is not supplied in the course source. Follow the teacher's direction and never broaden access merely to make a link easier to open.

A saved link is not automatically submitted

The verified Website Link prompt asks for a website link. A complete link record should identify the intended site and be checked from an approved viewer context. Saving it in this local course browser preserves a working draft only; it does not send the link to a teacher. Follow the teacher's nominated submission pathway when supplied and avoid placing edit links or private account information in a public location.

Worked example: report the exact state

A student previews the site and saves its address locally, but the approved viewer still receives an access request. The honest status is "previewed and link recorded; viewer access not yet confirmed". It is not "submitted" or "public". The student checks for an accidental edit URL, records the issue and waits for the teacher's access direction. Precise state language prevents false confidence and unsafe permission changes.

Apply your understanding

A site is previewed and its viewer link is saved, but an approved viewer gets an access request and no audience setting has been supplied. What is the honest status?

- a) Previewed and link recorded; access unconfirmed while teacher direction is awaited
- b) Published, public and submitted because a complete viewer link already exists
- c) Not created because the approved viewer could not open the current version

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-09.html#m09-s03>

MODULE 10 / PRESENT, EVALUATE, IMPROVE

Success criteria and feedback

Criteria turn goals into checks

A success criterion describes a quality that can be observed or judged with evidence. “Looks good” is too vague. “The same core logo and palette roles are recognisable across the poster, uniform concept, animation and site” can be checked. Criteria should come from the brief, audience needs and taught design principles. Different evidence may be needed for recognition, readability, honesty and navigation.

Feedback is evidence, not an order

Feedback becomes useful when the reviewer completes a focused task and explains what happened. Preference comments can matter, but they should not overrule access, truthfulness or brief requirements. Record who or what type of user context was represented without collecting unnecessary personal data. Look for patterns, contradictions and limitations, then decide which changes have the strongest reason.

Figure 28. Illustrative peer critique. Notes point to features and criteria; attractive presentation and a small sample do not prove success for every user.

Worked example: criterion, evidence, judgement

Criterion: users can identify the brand across four outputs. Evidence: three reviewers correctly grouped the poster, uniform, animation and site header, but two missed the menu because its logo used an unrelated colour. Judgement: the criterion is partly met. Revision: restore an approved palette role on the menu and repeat the grouping task. The wording reports the small test honestly rather than claiming universal recognition.

Apply your understanding

Three reviewers like a poster's colours, but a finding task shows that the action button is repeatedly missed. Which judgement is strongest?

- a) The poster is successful because three positive comments outweigh one task result
- b) The colour system has failed because the action button was difficult to find
- c) Colour appeal has support, but action hierarchy needs revision and another test

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-10.html#m10-s01>

MODULE 10 / PRESENT, EVALUATE, IMPROVE

Explaining design decisions

A rationale explains why

A design rationale is not a list of software steps. It explains an important choice, the reason connected to the brief or audience, the evidence considered and the result. Subject vocabulary makes the relationship precise: hierarchy, contrast, variant, transition and information architecture identify what was controlled. Select decisions that shaped the outcome rather than narrating every click.

Use a claim–evidence–reasoning chain

Begin with a claim about the choice, cite visible or tested evidence and explain why the evidence supports the claim. “I used orange because it looks good” is preference. “Orange is limited to the main action; phone-size testing showed it separates from the cream background without carrying small text” links role and evidence. If evidence is mixed, acknowledge the trade-off rather than hiding it.

Worked example: explain a revision

1 Identify the original

The first site header used the full logo and slogan.

2 Observe the problem

At phone width the slogan wrapped and pushed navigation down.

3 Make a controlled change

The student changed to the compact variant while preserving the circular bite and brand colours.

4 Test the revised version

A second test showed the title and navigation without overflow.

5 Explain the connection

The rationale names the problem, the controlled change, the preserved identity and the new evidence.

6 State the limitation

It does not claim that one phone test proves every device will work.

Figure 29. Illustrative evidence workspace. Compare versions alongside recorded observations so a reason for changing a design can be traced.

Apply your understanding

A student writes, “I used a gradient because it looks cool,” but testing shows the headline loses contrast over one end. How should the rationale improve?

- a) Keep the sentence and add a longer list of gradient-tool steps
- b) Explain the gradient's intended role, the contrast finding and the focused revision
- c) Remove the test result so the original colour preference sounds stronger

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-10.html#m10-s02>

MODULE 10 / PRESENT, EVALUATE, IMPROVE

Evaluation and next iteration

Evaluation is a judgement, not a description

Evaluation asks how well the connected solution met its purpose and criteria. It should identify strengths, limitations and evidence across the logo, menu, poster, uniform concept, animation and site. The supplied unit form offers question prompts that can help organise reflection. Write from your own process records and feedback; do not invent audience findings or claim that local browser work was submitted.

A useful improvement is specific

“Make it better” cannot guide a next iteration. Name what will change, why the evidence calls for it, how it will be changed and what result will be tested. Prioritise changes by likely effect and effort. Fixing a broken navigation pathway may matter more than adding decorative motion. Preserve backups before revision so earlier evidence remains available for comparison.

Figure 30. Fictional before-and-after layout study. A revised header and a smaller-screen check can support a rationale. The people and records pictured are illustrative, not student evidence.

Worked example: close the loop

Evidence shows the brand is recognisable and the poster hierarchy works, but phone users miss the Products link and the motion-ad slogan disappears too quickly. The student prioritises navigation first, renames and retests the link, then extends the slogan state and re-exports. They compare before and after records, explain what improved and retain a remaining question about authorised site access. The evaluation leads directly into another design cycle.

Apply your understanding

Phone users cannot find the Products link, while reviewers give mixed preferences about the poster colour. Which improvement should be prioritised first?

- a) Fix and retest the navigation pathway before considering the colour preference
- b) Change the poster colour first because preference may affect engagement
- c) Add decorative motion to both outputs and postpone the recorded issues

Online: <https://stevencowell.github.io/Year-7-Multimedia/modules/module-10.html#m10-s03>

FOLIO 08 / EVIDENCE AND ACCESS

Web portfolio and evaluation

Record the website evidence and evaluate how well the connected brand meets the brief.

Which evidence best shows that the website and brand solve the original design challenge?

Add a privacy-safe final website screenshot

Before importing a screenshot, crop out profile photos, names, email addresses, account menus, comments and sharing details.

Image caption - what does this evidence prove?

Explain what the final website screenshot demonstrates.

Website link or teacher-approved location

Pages, media and access check

Record how you checked Home, Products and Contact Us, the media, links and approved viewing access.

FOLIO 08 / FEEDBACK AND NEXT IMPROVEMENT

Use evidence to evaluate

The final website should bring the brand together and show what you would improve next.

A saved link is preparation, not proof of access or formal submission. Use the sharing setting and hand-in route your teacher provides.

Useful feedback and response

State the feedback you used and what you changed or chose not to change.

Evaluation against the brief and criteria

Use evidence to explain what worked, what did not and one realistic next improvement.

The strongest evidence is... because... / Feedback led me to...

If I had another lesson, I would...

Online: <https://stevenowell.github.io/Year-7-Multimedia/folio.html#folio-stage-web-evaluation>
